Certificate

This is to certify that Mr. Thennarasu, S. has carried out the research work embodied in the present thesis entitled, **A STATISTICAL STUDY OF TAMIL MORPHOLOGY** for the degree of Doctor of Philosophy in Applied Linguistics, which is prepared under my supervision. I declare to the best of my knowledge that no part of this thesis was earlier submitted for the award of any degree, to any other institution or university.

Prof. G. Uma Maheswara Rao
Supervisor

Prof. N. Krupanandam
Head of the department

Prof. Mohan G Ramanan
Dean of the School of Humanities

Centre for Applied Linguistics and Translation Studies
School of Humanities
UNIVERSITY OF HYDERABAD
HYDERABAD – 500046 (A.P.) INDIA

DECLARATION

I hereby declare that the research embodied in the present thesis entitled, **A STATISTICAL STUDY OF TAMIL MORPHOLOGY** has been carried out by me, under the supervision of Prof. G. Uma Maheshwara Rao at the Centre for Applied Linguistics & Translation studies (CALTS), for the award of Doctor of Philosophy in Applied Linguistics from the University of Hyderabad. I declare to the best of my knowledge that no part of this thesis was earlier submitted for the award of research degree in part or full to this or any other university.

Place: Hyderabad

Date: April 2012

We have chosen the Roman transliteration scheme (wx-notation) for the purpose of easy processing. WX-notation is an extremely convenient roman transliteration scheme for all Indian languages (cf. Uma Maheshwar Rao, 2001). It is an exact character mapping. This scheme is characterized by the use of the characters w-x voiceless and voiced dental stops, hence the name wx-notation. There are a number of advantages using the text in wx-roman notation, since it follows a strictly Tamil orthographic scheme, which is near phonemic in nature. It is easy to convert from this roman transliteration to ISCII, UNICODE and display it in Tamil at the stroke of a button on the keyboard.

LIST OF ABBREVIATIONS

3ps = Third Person Singular

Abl = Ablative

Acc = Accusative

Adj = Adjective

ASR = Automatic Speech Recognition

B = base

BC = Brown Corpus

CALTS = Centre for Applied Linguistics and Translation Studies

CC = Consonant Consonant

cd = change directories

CIIL = Central Institute of Indian Languages

CM = Case Marker

cp = copy

CV = Consonant Vowel

CVC = Consonant Vowel Consonant

Dat = Dative

Det = Determiner

EMILLE = Enabling Minority Language Engineering

fem = Feminine

find = search for files in a directory

FST = Finite State Transducer

Fut = future

grep = print lines matching a pattern

history = prints recently used commands

Ins = Instrumental

ISCII = Indian Script Code for Information Interchange

ISO = International Organization for Standardization

LDC-IL = Linguistic Data Consortium for Indian Languages

Loc = Locative

LTL = Language Technology Lab

MA = Morphological Analyzer

Mas = Masculine

MC = Morphophonemic Change

mkdir = make directory

MT = Machine Translation

mv = move or rename a file

N = Noun

NC = Noun Common

Neu = Neutral

N-gram = Number of gram (number of sequences of words/morphemes separated by space(s)

NLP = Natural Language Processing

NNs = noun noun strings

P = Prefix

P(E) = Probability Estimate

Perl = Practical Extraction and Reporting Language

PL = Plural

POS = Part-of-Speech

Prn = Pronoun

Prs = present

Pst = past

PUN = Punctuation

pwd = print name of current working directory

rm = remove files or directories

S = Stem

SC = Spell Checker

Sg = Singular

Soc = Sociative

sort = sort lines of text in a file

SOV = Subject Object Verb

SVO = Subject Verb Object

TTS = Text-to-Speech

V = Verb

VC = Vowel Consonant

VCC = Vowel Consonant Consonant

VCV = Vowel Consonant Vowel

vim = Vi Improved

VM = Verb Main

wc = print the number of newlines, words, and bytes in files

WFR = Word Formation Rule

WSD = Word Sense Disambiguation

Heartfelt Thanks

. . . to my supervisor professor G. Uma Maheshwar Rao for giving me the opportunity to develop our ideas to be translated them into applications. I would like to thank him for teaching me how to think and work in a way, which is different from conventional and routine doing. I will always remember all precious lessons he gave me. Thank from the depths of my heart.

. . . to Managers of Lancaster University, UK for EMILLE Corpus, CALTS, University of Hyderabad for CIIL-TDIL Corpus, and Bible Society of India, Bangalore for Bible corpus for providing me their corpora (data) to carry out my linguistic investigation; and for insisting that I must see the numbers behind the words. Special thanks to Mr. Winston Cruz who helped me to get EMILLE Corpus.

. . . to Professor Panchanan Mohanty, and Prof. N. Krupanandam Director, CALTS and those who have been my doctoral committee members, Centre for Applied Linguistics and Translation Studies, University of Hyderabad, Prof. B. D. Jayaram and Miss. Vidya for introducing me the basic concepts of statistics and probability, Dr.Niladri Sekhar Dash, ISI, Kolkata for sharing some of his articles which are related to statistical study, Dr. L. Ramamoorthy, Head, LDC-IL, Prof. N. Nadaraja Pillai CIIL, Mysore for their comments and suggestions on this work.

. . .to all my teachers at the Centre for Applied Linguistics and Translation Studies (CALTS) who taught me all basics of computational research in to be able to deal with the NLP applications.

…. a special thanks to madam Mrs. Bharani Garapati, Ms. Parameshwari Krishnamurthy, Ms. Mayuri Dilip, Mr. Christopher, Mr. Srinivas, Mr. PVSR Murthy, Mr. Mallesh, Mr. Sathish, Mrs. Anuradha, Mr. P. Mohana Rao, Mr. K. Murali, and Mr. L. R. Prem Kumar for their timely help.

. . .to everyone at CALTS Language Technology Lab for an environment that was fun and inspiring.

. . . to my wife Valarmathi, T. and my parents, brothers and sisters for their support and patience on the many days when I was fighting to complete this work. Without them, none of this would have been possible.

… to brother Dr. Matthew P., and my LDC-IL Team for their continuous encouragement and support.

. . . and to the Almighty GOD for making it all worth-while.

Thennarasu, S.

CHAPTER 3

CHAPTER 4

CHAPTER-1

1. 0 INTRODUCTION

Tamil is, not only one of the classical languages of India, but it is also one of the major languages of the Dravidian family of languages. Most of the persons speaking Tamil language reside in the Indian State of Tamil Nadu, it is also spoken in many parts of the world. Large concentration of Tamil speaking people are located in Sri Lanka, Malaysia, and Singapore, as also in other South Indian states of Andhra Pradesh, Karnataka, and Kerala and major cities of India. In fact, Tamil speaking people are found in all the time zones of the world. There are more than 72 million people who speak Tamil as their native language (Census 2011). It is also official State language in Tamil Nadu and Pondicherry.

Typologically, Tamil is an agglutinating language which involves joining morphemes together to generate new words (Lehmann, 1989). Agglutinative languages, theoretically speaking, present rich but simple morphology, since the ratio between the number of morphemes and the number of morphological categories (features) that they signal is close to one. However, many modern Indian languages, though agglutinative in its morphology in the usual sense of the term, present a highly complex morphology in its surface realization. Any computational analysis of these languages particularly Dravidian languages requires a deeper understanding and analysis of certain facts about the design features of their morphology. In agglutination, as long as the correspondence between the forms and the formatives (morphological features) remain constant, the long chains of so called complex word-forms do not really offer morphological complexity. However, when languages introduce allomorphy the entire perception drastically changes. Allomorphy not only tends to erase boundaries between the morphemes but introduce the concept of variability into the morphology,

making thus the agglutinative morphology a complex phenomenon. Any computational architecture must have a mechanism in its design feature that deals with this kind of morphology (Uma Maheshwar Rao, 2011). It is known that morphology of Tamil is considerably rich and complex. It is important to study and understand the complexity of Tamil Morphology in order to find out the specific patterns of the morphology and their statistical distribution. Usually, word forms in Tamil are long, and consist of two to as many as eight or nine or more. One of the aspects of an investigation is to find out which patterns or morphological word-forms are common or productive. In Tamil, major lexical categories are open ended i.e. they are created through a number of morphological processes and new forms are added to the language. For a meaningful modeling of the morphology of Tamil, it is essential to study the corpus of written Tamil to get an overview of the word and the units within and also their distribution. The corpus based statistical analysis is essential in understanding the distributional patterns of morphological elements. The analysis might include, quantitative results and statistical evaluation, optimization of formation of rules or knowledge discovery methods which help us to build NLP applications into the area of morphology for the purposes of Machine Translation, Computational Lexicography, Morphological analyzer, Morphological generator, Text Generations, Dictionary tools, Lemmatization, Speech applications, Grammar Checking, Spell Checking, etc.

Morphological complexity of Dravidian Languages warrants us the need for thorough morphological analysis. Morphological analysis should be the first step towards any Indian Language Processing task (Shrivastava et al. 2004).

The purpose of the Statistical Analysis of Tamil Morphology is to find out the frequency of lexical (word/word-forms) formatives, functional but bound elements and occurrence of coverages, and their bigramic, trigrammic probabilistic association of categories. Similarly, one needs to know the most

frequent affixes and their variants, most frequent patterns in combination, most frequent allomorphs, most frequent stems/roots, frequencies of morphophonemic changes. This work would greatly enhance the researcher to understand the morphology of Tamil, and it can be used as a great resource in building morphological tools and NLP application.

I. MORPHOLOGY OF LANGUAGE

Every language in the world, whether it is written, spoken or signed contains morphology in both the production of language, as well as its understanding (Wicentowski, 2002 as stated in Booij, G. E. 2007).

Morphology plays two central roles in language. In its first role, as derivational morphology, it allows existing words to be used as bases for forming new words with different meanings and different functionalities. In other words, derivation is the formation of new words or inflectable stems from other words. They typically occur by the addition of one or more affixes. The derived word is often of a different word class from the original. It may thus take the inflectional affixes of the new word class e.g. azaku (beauty) + āṉa = azakāṉa 'beautiful' which is a derived adjective. In the above example, the word azakāṉa is an adjective derived from the noun azaku, and the adjective marker -āṉa.

In its second role, as inflectional morphology it deals various morpho-syntactic categories of the language in terms of person (nāṉ vantēṉ, nī vantāy, avaṉ vantāṉ, number (oru māṇavaṉ, iraṇṭu māṇavarkaḷ), gender (avaṉ, avaḷ, atu, avaṉ/avaḷ/atu), and case (-ai, -kku, -ukkāka, -āl, -ōṭu, -uṭaṉ, -il, -illiruntu, -iṉ and -atu) in case of nouns; tense (paṭittēṉ, paṭikkiṟēṉ, paṭippēṉ) aspect and modal categories (vantukkoṇṭirukkiṟāṉ, ceyyalām) in case of verbs. These morpho-syntactic features, required in varying degrees by different languages which do not change part of speech of the word and do not change the

underlying meaning of the word. In other words, inflection is variation in the form of a word, typically by means of an affix, that expresses a grammatical contrast, which is characteristic of the stem's word class in some given grammatical context. The following are examples of inflection in Tamil: āciriyar-kaḷ-ukk-āka 'for the sake of teachers'. pēccāḷarkaḷ 'speakers', ezuttāḷarkaḷ 'writers', pāṭakarkaḷ 'singers'. In order to produce these, one begin with a root word, for example, the Tamil verbs pēcu, ezutu, pāṭu etc. governed by a set of morpho-syntactic features (for example, past, masculine, third person, singular), form the appropriately inflected forms.

II. MORPHOLOGICAL PHENOMENA

The term 'morphology' has been taken over from biology where it is used to denote the study of the forms of plants and animals first recorded use is in writings by the German poet and writer Goethe (1796). It was first used for linguistic purposes in 1859 by the German linguist August Schleicher (cf. Salmon 2000), to refer to the study of the form of words (cf. Booij, 2007). In other words, morphology is the study of the internal structure and concerned with the analysis of words. In this way, it is partially analogous to biological morphology, which studies the internal structures of animals. Just as every animal is a structured combination of organs, every word in every language of the world is a structured combination of morphemes.

Each morpheme is an individual unit of meaning. Words are formed from a combination of one or more free or bound morphemes. Free morphemes are units of meaning which can stand on their own as words. Bound morphemes are also units of meaning, but, can not occur as words on their own. However, they can only occur in combination with free morphemes. From this definition, it follows that a word is either a single free morpheme, or a combination of a single free morpheme with one or more free or bound morphemes.

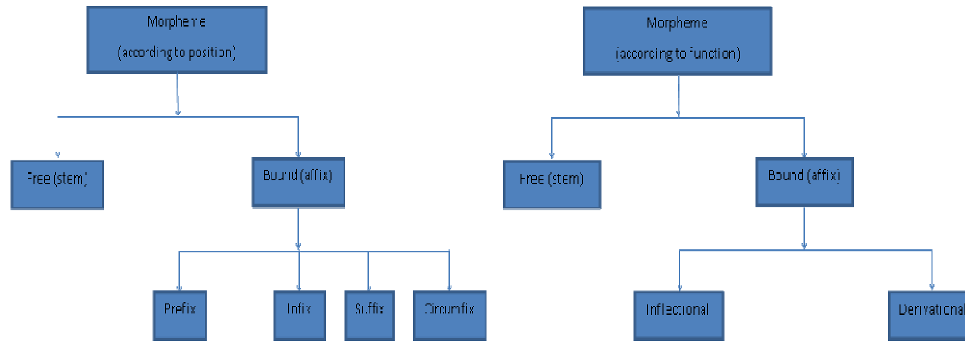

Figure-1 Classification of morphemes

The Tamil word peṇkaḷ 'girls', for example, is comprised of two morphemes, peṇ+kaḷ. Since peṇ 'girl' is an individual unit of meaning which cannot be broken down further into smaller units of meaning, it is a morpheme. And, since peṇ can occur on its own as a word in the language, it is a free morpheme. The unit -kaḷ can be suffixed to a large number of nouns in Tamil to create the plural forms of nouns. Since -kaḷ has a meaning, and cannot be segmented into smaller units, it is a morpheme. However, -kaḷ can occur only as a part of another word, not on its own; Therefore, it is a bound morpheme.

The process by which bound morphemes are attached to free morphemes can often be described using a word formation rule. For example, addition of -kaḷ or -kkaḷ to a noun to form the plural form of that noun is described as word formation. When such a process can be used to explain a number of word forms in the language, the word formation rule is said to be regular and productive too.

Each of the regular word formation rules can be classified as realizing one or more of a set of morphological phenomena which are found in most of the Indian languages. These phenomena include:

1. Simple affixation: adding a single morpheme (an affix) at the beginning (prefix), end (suffix), middle (infix), or both at the beginning

and the end (circumfix) of a root/stem form. Affixation may involve morpho-phonological changes at the location where the affix is added.

2. Vowel harmony: In affixation where the phonological content of the resulting inflection may be altered from affixation to obey systematic preferences for vowel agreement between the root and affix.

3. Internal vowel shifts: systematic changes in the vowel(s) between the inflection and the root often, but not always, associated with the addition of an affix.

4. Agglutination: multiple affixes are "glued" together (concatenated) in constrained sequences to form inflected word forms.

5. Reduplication: words are derived from repetition of partial or complete copies of the stems.

6. Template filling: inflections are formed from roots using an applied pattern of affixation, vowel insertion, and other phonological changes.

1. 1 FOREGROUNDING THE PROBLEM

The present study entitled 'A **STATISTICAL STUDY OF TAMIL MORPHOLOGY'** involves the observation and recording of the facts about the following:

…most frequently occurring suffixes in the Tamil morphology.

…most frequently occurring suffix sequences in the corpus.

…most common patterns of suffixes.

…most frequent suffixes displaying allomorphic variation.

…most frequent nominal inflections.

…most frequent occurring postpositions.

…most frequently occurring complex postpositions.

…most frequent verbal inflections.

…most frequent auxiliary verbs.

…most frequent patterns of verb complexes.

…most frequent adjectives.

…most frequent adverbs.

Not only recording the facts but also finding out their coverage in the corpus is an important aspect of this study. An understanding of these facts may throw light on the understanding of Tamil Morphology. These facts may relate to the process in the learning of Tamil Morphology by children and the learners of Tamil as second language. These facts also crucially contribute to the developmental strategies in Natural Language Processing Applications, in terms of how much effort one should put in order to achieve a certain amount of coverage, recognition rate or accuracy rate within a certain period of time in an application. One may even predict how to tackle morphological problems or issues in a more faster way and predict the time required. Knowing these facts allow us to compare the morphologies of similar or dissimilar languages empirically examined from typologically point of view for better advantages.

1. 2 MORPHOLOGICAL THEORIES

Theories of morphology differ in their view with respect to the morpheme, as a building block or as a basic unit of morphological analysis. The relevant issues in the pursuit of research in morphology therefore remain in focus with respect to the identification and the realization, of the unique and unification functional aspects of the basic morphological unit.

The two models of morphology such as the Item and Arrangement (Hockett 1954), and Item and Process (Hockett 1954) embody structuralism in morphology. A morpheme, in that sense, was 'the smallest individually meaningful element in the utterance of a language' (Hockett 1954).

The Item and Arrangement Model (IA) assumes a concatenative approach wherein morphemes are lexical units, morphology is an agglutination of such units, and words are seen as linear sequences of morphs. The central observation of the model is that certain forms reflect a partial phonetic-semantic resemblance to other forms. Describing the morphological patterning of a language would in consequence involve a specification, of the inventory of morphemes (items), of the possible sequences in which these morphemes of the language is realized (a morphological link). A word is analyzed as involving no process at all, but only a permissive sequence of morphemes. The IA model is thus essentially morphemic, but non-processual.

The Item and Process (IP) model works on the conception that word-forms constitute paired features of structure and function rather form and meaning, and that element undergo a variety of modifications, through transformations, to result in newer forms. Morphology is regarded as a set of derivational processes, acting on morphemes or words, producing new word-forms. Hence, in IP, there is only one recognized underlying basic allomorph that contextually takes the form of an allomorph.

In contrast, the Word and Paradigm (WP) (Robbins 1963), model of morphology takes the 'word' operating within a paradigm of variables, as its basic unit. The WP model is distinct in that if focuses primarily on each word as a whole, and on its overall effect to the unique set of properties that it expresses. The model evades complexities since it divides the word into two parallel non-overlapping units: one for formal elements, and the other for functional properties. In the WP framework, it is a morphophonemic rule, a conglomerated set of morphosyntactic projection and morphosemantic operation that align with a word, and not a phonological rule. Parallel to instances in analytic phonology, there exist no absolute constraints that might limit the nature or number of correspondences between morphological

properties and morphological forms (Uma Maheshwar Rao, 2000 and Vaishnavi, R., 2003).

1. 3 PROBABILISTIC METHODS IN THE STUDY OF LANGUAGE

DESCRIPTIONS

A. PROBABILITY IN LANGUAGE

Probability has a precise statistical meaning, for example 'a measure of the relative frequency or likelihood of occurrence of an event, whose values lie between zero (impossibility) and one (certainty), derived from a theoretical distribution or from observations' (Collins, 1979). However, its general usage is less clear, including its use within the risk management process. Confusion can also arise as a result of the use of alternative terms in risk guidelines to describe the uncertainty dimension, such as frequency, likelihood or chance, giving the impression that these are mere synonyms for probability when in fact they are distinctly different. If the uncertainty dimension of risks is to be properly assessed and described using the term 'probability', assessors must understand what they are trying to assess. Consider the following procedure to arrive at a simple probability measure.

> I imagine picking words or suffixes out of a cup, one at a time. On each occasion, you note the word and put it back. Given that there are 7070 words in the cup, and 7 of them are function words, the probability of picking function word out of the cup is p(function word) = 7/7070 = 0.00099. This is the fraction of time you expect to see function word if you draw one word.

PROBABILITY MODEL

This section introduces a prior probability distribution over the space of all hypotheses, where a hypothesis is a set of words, each with morphological

split separating the stem and suffix. The distribution is based on a seven-step model for the generation of hypotheses, which is heavily based upon the probability model (Matthew, D. et al 2001). The hypothesis is generated by choosing the number of stems and suffixes, the spellings of those stems and suffixes and then the combination of the stems and suffixes.

The seven steps are presented below, along with their probability distributions and a running example of how a hypothesis could be generated by this process. By taking the product over the distributions from all of the steps of the generative process, one can calculate the prior probability for any given hypothesis. What is described in this section is a mathematical model and not an algorithm intended to be run.

1. Choose the number of stems, *M*, according to the distribution:

$$\Pr(M) = \frac{6}{\pi^2}\left(\frac{1}{M}\right)^2 \quad (1)$$

The $6/\pi^2$ term normalizes the inverse-squared distribution on the positive integers. The number of suffixes, *X* is chosen according to the same probability distribution. The symbols M for steMs and X for suffiXes are used here.

Example: M = 5. X = 3.

2. For each stem *i*, choose its length in letters L_i^m, according to the inverse squared distribution. Assuming that the lengths are chosen independently and multiplying together their probabilities we have:

$$\Pr(L^m \mid M) = \left(\frac{6}{\pi^2}\right)^M \prod_{i=1}^{M}\left(\frac{1}{L_i^m}\right)^2 \quad (2)$$

The distribution for the lengths of the suffixes, L^x, is similar to (2), differing only in that suffixes of length 0 are allowed, by offsetting the length by one.

Example: $\boldsymbol{L^m = 4, 4, 4, 3, 3.\ L^x = 2, 0, 1.}$

3. Let Σ be the alphabet, and let $\{P_1 \dots P|\Sigma|\}$ be a probability distribution on Σ. For each

i from 1 to M, generate stem i by choosing L_i^m letters at random, according to the probabilities $\{P_1 \dots P|\Sigma|\}$. Call the resulting stem set STEM. The suffix set SUFF is generated in the same manner. The probability of any character, l, being chosen is obtained from a maximum likelihood estimate: $\hat{p}_l = \frac{c_l}{S}$ where c_l. is the count of

l among all the hypothesized stems and suffixes and $S \doteq \sum_l c_l$. The joint probability of the hypothesized stem and suffix sets is defined by the distribution:

$$\Pr(\text{STEM}, \text{SUFF} \mid M, L^m, X, L^x) = M!X! \prod_{l \in \Sigma} \left(\frac{c_l}{S}\right)^{c_l} \quad (3)$$

The factorial terms reflect the fact that the stems and suffixes could be generated in any order.

Example: STEM = {walk, look, door, far, cat}. SUFF = { ed, ϵ, s}.

4. We now choose the number of paradigms, P. A paradigm is a set of suffixes and the stems that attach to those suffixes and no others. Each stem is in exactly one paradigm, and each paradigm has at least one stem, thus P can range from 1 to M. We pick P according to the following uniform distribution:

$$\Pr(P \mid M) = M^{-1} \quad (4)$$

Example: P = 3.

5. We choose the number of suffixes in the paradigms, D, according to a uniform distribution. The distribution for picking D_i, suffixes for paradigm i is :

$$\Pr(D_i \mid XP) = \frac{1}{X}$$

The joint probability over all paradigms, D is therefore:

$$\Pr(D \mid XP) = \prod_{i=1}^{P} X^{-1} = \left(\frac{1}{X}\right)^{P} \quad (5)$$

***Example:* D = {2, 1, 2 }.**

6. For each paragim i, choose the set of Di suffixes, PARA_i^x that the paradigm will represent. The number of subsets of a given size is finite so we can again use the uniform distribution. This implies that the probability of each individual subset of size D_i, is the inverse of the total number of such subsets. Assuming that the choices for each paradigm are independent:

$$\Pr(\text{PARA}^x \mid XPD) = \prod_{i=1}^{P} \binom{X}{D_i}^{-1} = \binom{X}{D_i}^{-P} \quad (6)$$

Example: $\text{PARA}_1^x = \{\epsilon, s, ed\}$. $\text{PARA}_2^x = \{\epsilon\}$. $\text{PARA}_3^x = \{\epsilon, s\}$.

7. For each stem choose the paradigm that the stem will belong in, according to a distribution that favors paradigms with more stems. The probability of choosing a paradigm i, for a stem is calculated using a maximum likelihood estimate:

$$\frac{|\text{PARA}_i^m|}{M}$$

Where PARA_1^x is the set of stems in paradigm i. Assuming that all these choices are made independently yields the following:

$$\Pr(\text{PARA}^m \mid MXP) = \prod_{i=1}^{P} \left(\frac{|\text{PARA}_i^m|}{M}\right)^{|\text{PARA}_i^m|} \quad (7)$$

Example: $\text{PARA}_1^m = \{walk, look\}$. $\text{PARA}_2^m = \{far\}$. $\text{PARA}_3^m = \{door, cat\}$.

Combining the results of stages 6 and 7, one can see that the running example would yield the hypothesis consisting of the set of words with suffix breaks, { walk+ ∈, walk+s, walk+ed, look+∈, look+s, look+ed, far+∈, door+∈, door+s, cat+∈, cat+s. Removing the breaks in the words results in the set of input words. To find the probability for this hypothesis just take of the product of the probabilities from equations (1) to (7).

Using this generative model, we can assign a probability to any hypothesis. Typically one wishes to know the probability of the hypothesis given the data, however in our case such a distribution is not required. Equation (8) shows how the probability of the hypothesis given the data could be derived from Bayes law.

$$\Pr(\text{Hyp} \mid \text{Data}) = \frac{\Pr(\text{Hyp}) \Pr(\text{Data} \mid \text{Hyp})}{\Pr(\text{Data})} \tag{8}$$

Our search only considers hypotheses consistent with the data. The probability of the data given the hypothesis, Pr(Data|Hyp), is always 1, since if you remove the breaks from any hypothesis, the input data is produced. This would not be the case if our search considered inconsistent hypotheses. The prior probability of the data is constant over all hypotheses, thus the probability of the hypothesis given the data reduces to Pr(Hyp)/c. The prior probability of the hypothesis is given by the above generative process and, among all consistent hypotheses; the one with the greatest prior probability also has the greatest posterior probability.

B. NGRAM PROBABILITIES

The basis of probability is the idea of an event. An event is just something which may or may not happen, like a word, morpheme and character may or may not go with another in the corpus of particular language or like a tossed coin landing heads may or may not go with another.

Probabilities: We follow the definition of Chris Brew et al (2004) which says that if x_i is a possible outcome of X, we define a probability: $P(X = x_i)$ which is abbreviated to $P(x_i)$ when there is no possibility of confusion about which event is meant. Similar notation uses $|X = x_i|$ for the number of times x_i occurs during a collection of trials. The probability of an outcome is defined to be the limit of the ratio between the number of times the outcome occurs and the number of trials attempted. Our sketchy formal definition of probability is:

$$P(X = x_i) \equiv \frac{|x_i|}{\sum_{j=1}^{k} |x_j|} = 1$$

We describe and analyze the probability of words, morphemes and their sequences predicted in the give corpus and then hypothesize that it is a reflection of the morphology of the language.

1. 4 AIM AND SCOPE OF THE STUDY

The major objectives of the present investigation are

a. To build a repertoire of statistical data on various morphological forms in written Tamil
b. To make a statistical study of the data collected, calculate various statistical measures, analyze and interpret them in relation to various morphological structures in written Tamil with the help of various mathematical and statistical tools.

1. 5 INTRODUCTION TO TAMIL MORPHOLOGY

What is productive?

There is disagreement in the literature with the notion of productivity. For some scholars particular affixes are productive (Lulofs 1835: 157, cited in Schultink 1992a: 189; Fleischer 1975:71); for others, morphological processes are productive (Uhlenbeck 1987: 4; Anderson 1982:585); for yet others, rules are productive (Arnoff 1976:36; Zwanenburg 1980: 248; Bakken 1998:28); for some, words are productive (Saussure 1969:228); for some, groups of processes are productive (Al and Booij 1981:32; Anderson 1982:585); in Bauer (1983: 65-74) devotes a complete chapter on productivity; for another group of scholars productivity is a feature of the language system as a whole.

By and large these various descriptions can be seen as differing statements of a single phenomenon, with a greater or lesser degree of specificity. The problem with assigning productivity as a feature to affixes is

that there are some word-formation processes which are non-affixal, but which may nevertheless be productive (Sauer, L, 2001).

Production models have usually used as examples the simplest morphological form of a word, the root, or sometimes the root with a single suffix or prefix, (Butterworth, 1989; Dell and O' Seaghdha, 1992; Levelt, 1989, 1992). Words with multiple affixes, various morphological types of affixes, and most of the different affixation processes used in languages have yet to be systematically examined in the production domain. As a result, only a small subset of the types of words in languages lexical inventories have actually been considered.

For example, languages like Tamil, Telugu, Malayalam and Kannada which are agglutinative in nature, build words by stacking multiple suffixes and/or prefixes though to less extent onto roots and stems. Affixes in many languages encode various types of morphological and/or syntactic information, and the mechanisms proposed for obtaining information in language production need to be matched to the wide range of syntactically conditioned affixes found in languages. Furthermore, morphemes in many languages encode information from even higher levels of linguistic structure, such as marking the topic of focus of the discourse, which would mean that these higher levels of linguistic structure must also be able to inform the word formation process.

In order to have a viable account of language production, we need to include all of the morphologically complex types of word used in languages. An examination of different morphological systems may well lead us to different types of mental lexical representations and different production processes than those envisaged so far.

According to Halle (1973) morphemes are the basic units of the lexicon whereas according to Aronoff (1976) words are the basic units of the lexeme. In other words, morphology is morpheme-based and word-based according

to Halle and Aronoff respectively. However, it seems that the word-based hypothesis is subject to typological differences (Hostra et al 1979:20, Scalise 1984:74.

A few restrictions on the attachment of suffixes and words to the base in order to derive grammatical words and to exclude ungrammatical combinations the other part tries to propose some Word Formation Rules (henceforth it is WFR) for Tamil. It has been stated earlier that the base may be a stem or a word to which either a suffix or a word may be attached to derive a new word. WFR may specify the suffix or word to be attached to the base. In the process of attaching suffixes or words to these basic lexical formatives, either one or more suffixes may be attached, or another lexical formatives or another lexical formative followed by a suffix may be attached to the base. In inflectional Morphology, many suffixes may be attached to the base.

1. 5. 1 STANDARD WRITTEN TAMIL

A Modern Written Tamil is a written form of the Tamil used in all the written works. It drastically differs from the spoken colloquial style significantly in terms of rules of phonology, morphology mostly but to be lesser extent in other areas of grammar. The standard form is preferred in writing, and is also used for public speaking. While written Tamil is believed to have more or less a common standard form in various Tamil speaking regions where spoken forms of the language differs widely from place to place. Spoken Tamil unlike written Tamil is more informal against formal nature of the difference between spoken and written Tamil. This situation has counterparts in the other literary Dravidian languages like Kannada, Telugu and Malayalam to some extent. Could such difference be attributed to Tamil diglossia? Written Standard variety continues to enjoy considerable prestige, and written standard Tamil is clearly useful as a global lingua franca among Tamils. In

comparison, spoken language that has historically been stigmatized, and a debate continues about the extent to which spoken forms should be encouraged, and even simply tolerated, in education.

1. 6 EARLIER STUDIES

Though extensive work in the area of Quantitative studies has been done in other languages, like English and other European languages, limited cases of such works are available in Indian languages. In Tamil, such studies have been done with a limited purpose. They are positively innovatory works. Thus far they serve only a very limited purpose (Pandiyaraja, 2001). The following is a list of quantitative studies carried out with respect to Tamil language with a short sketch about each.

1. Pandiyaraja, P. (2001) Statistical Analysis of Linguistics Features in Written Tamil. Thesis submitted to the Department of Linguistics for the degree of PhD, Thanjavur University.

This study is based on 2,50,000 words collected from ancient literature, medieval literature and modern literature in Tamil. It discusses about occurrences of phonemes in Tamil and their relative stability or instability, occurrence of graphemes, transitional occurrences of phonemes and graphemes, calculus of phonemic distribution in terms of completeness and symmetry, word initial occurrences of phonemes and graphemes, word length distributions in terms of various types of word length and their interpretations, intercuts word length distributions to study the relation between various notations of writing, syllable distribution in polysyllable words in terms of initial, medial and final positions and in monosyllabic words, the distribution of phonemes over various types of syllables, the word type distribution in terms of the syllables, syllable types and related studies, entropy and other related measures at different levels and grammar load of phonemes. But it does not discuss anything with respect to inflectional and derivational morphology.

2. Ganeshsundaram, P. C. (1959) Distribution characteristics of speech elements in Tamil. Deccan college dissertation series: 19, Poona.

This is an analysis into the Typology of written Tamil at the phonemic and morphemic levels based on material constituting about 600 words collected from a Tamil text.

3. Ramakrishna, B. S. et al., (1962) Some Aspects of the Relative Efficiencies of Indian Languages – A Study from Information Theory point of view at Dept. of Electrical Communication Engineering, IISc, Bangalore.

The authors have selected 20,000 speech sounds in some of the Indian languages including Tamil and discussed the relative efficiencies of the language in conveying the same semantic content and also the relative transcription efficiencies of the languages.

4. Shanmugam, R. (1973) A frequency word list for modern Tamil. Dissertation submitted to Madurai University for the Ph.D. degree, Madurai.

This is a study based on about 1,00,000 words collected form various sources of modern written Tamil. But the statistical analysis of phoneme distribution and syllable length distribution of words was based on only 2635 words, which occurred 5 or more times. Computer programs were also claimed to have been used by the author for a pilot sample of 100 words but results were not made available. This could be taken as the first attempt for a statistical study of the usage of words in modern written Tamil. Zipf's law was verified to be true in the case of the relationship between frequency and rank of the occurrence of words in modern written Tamil.

5. Kameswari, T. M. (1982) The style of the language of avvaiya:rs. Dissertation submitted for the degree of Doctor of Philosophy in Linguistics, at Annamalai University.

In this analysis on the various Tamil literary works supposed to have been written by a poetess called *avvaiya:r*, the author uses statistical tools to establish the hypothesis that there were different *avvaiya:rs* possibly belonging

to different periods. This could be taken as the first attempt to use tools in quantitative linguistics for literary texts belonging to Sangam and medieval periods and this is also the first ever-scientific study in Tamil on authorship and style.

6. Chellamuthu, K. C. & Baskaran, (1986) Computer analysis of *tirukkuṟaḷ*, at Tamil University, Thanjavur.

The authors have digitized the complete text of *tirukkuṟaḷ,* a book of ancient Tamil literature consisting of 1330 couplets each having two lines. The results regarding words and grammatical patterns are discussed.

7. Thennarasu, S. 2005. A Statistical Study of Written Tamil Corpus. Unpublished M.Phil. Thesis. Hyderabad: University of Hyderabad.

This study is based about 3 million words CIIL Tamil corpus collected from different genres such as Aesthetics, Fine Arts, Social Science, Natural and Physical Sciences, Commerce, Official and Media Language, Translation Material and Spoken Tamil. It focuses on a statistical study of certain aspects of the written Tamil corpus. The study and the time limit it chosen to restrict themselves to cover only the phonological, morphological, lexical levels and not other aspects of the written Tamil corpus. This study attempted to reveal certain statistical aspects of various units of different linguistic levels, their distribution and their relevance in building NLP tools. It also helps to find out the characteristics of standard written language. Corpus study provides a concrete approach in finding evidence for standardization. The study involved the analysis of the corpus to find out the frequencies of certain linguistic units viz. characters, syllables, words and other morphological entities, their distribution, comparison and the linguistically relevant interpretations. In a way it focuses on the most frequently used words, coverage of words, frequency of syllables, frequency of characters, vowels and consonants, average size of wordforms in Tamil etc. Finding out the frequencies of certain morphological types and categories over other may

reveal a number of facts of the language. The corpus study has revealed both qualitative and quantitative aspects of language.

8. Uma Maheshwara Rao, G. and Thennarasu, S. (2007). Corpus Linguistics: PGDCAIL-421 published by Centre for Distance Education, University of Hyderabad, University of Hyderabad

This study presents a comparative account of the statistical analysis of Indian languages corpora with respect to certain aspects of the linguistic unit at morphological levels. This comparative study is based on basic statistics of the distribution words. Moreover, it focuses on the similarities and dissimilarities of the basic facts of these languages through their corpora. The corpora used here for Malayalam, Telugu, Kannada, Tamil, Marathi, Oriya, Bangla, Hindi and Punjabi are available at CALTS Language Technology Laboratory. The corpora are developed at different places such as IIT, Delhi, for Hindi, IIT, Mumbai for Marathi, and the Telugu and Tamil corpora were developed by CIIL, Mysore for TDIL, DIT Government of India.

The followings are the list of some of the noteworthy papers presented and published on quantitative studies concerning Tamil.

1. 6. 1 STUDYING LANGUAGE: THEORY AND PRACTICE

The descriptions of language can be based on either on the observation of naturally occurring discourse in use or on the intuition of a person who uses a

particular language. This key difference in the kind of data that forms the basis for a language theory behind the description marks two different approaches: empiricism and rationalism. Put simply, rationalist approaches to language are concerned with the way in which the mind processes language, while empiricist approaches are based on the observation of naturally occurring every phenomena. As far as linguistic judgments are concerned, rationalism is associated with introspection, e.g. a native speaker making judgments about the fact of his language based on intuition, while empiricism is associated with observing the distribution of entities in use, e.g. through a corpus of recorded discourse events (Svenja, 2006).

The influential American linguist Noam Chomsky (1957 & 1965) argued that linguistic study should be concerned with the exploration of language competence, i.e. the internalized knowledge of a language (I Language), rather than language performance, the external use of a language (E Language) (Chomsky, 1965). The main argument behind this suggestion was that Chomsky regarded performance data as limited and limiting in terms of what it can reveal about our language competence. He argued that performance can be affected by external events and is thus not an adequate representation of a speaker-listener's language competence. At the same time, Chomsky noted that no collection of naturally occurring discourse can ever be substantial enough to be a true representation of a language (see McEnery and Wilson 2001: 5-12 for a discussion of these points).

These arguments had a considerable impact on the way in which linguistics developed in the time following the publication of Chomsky's ideas. However, with advances in technology and the development of machine-readable corpora, empiricist approaches to language study steadily regained popularity in the latter half of the twentieth century. The limitation of corpus size is not anymore seen as arrangement in the context of the availability of billions of words length texts. Corpus studies have also shown that native-speaker intuition can be unreliable when it comes to making

judgments about language in use, and there are certain aspects of language that are simply not open to intuition, such as word frequency distributions for example. Furthermore, studies of naturally occurring data can be replicated and verified by other researchers which are not the case with those studies that are based entirely on the introspective judgments of one person.

However, native-speaker's intuition does have a place in empirical language research. It informs the types of queries we address with the use of a corpus, as well as our analysis and interpretation of the language evidence a corpus can provide (see McEnery et all. 2006: 6-7). This study introduces a number of examples of empirical language studies that illustrate this interplay between intuition, language in use and its interpretation.

1. 6. 2 STATISTICS IN LINGUISTICS

The place of statistics and frequencies in linguistics is not obvious, but then, it is not obvious that frequencies do not play a role either. The view that statistics does belong in linguistics is by no means new. Consider for instance the statement in Guiraud (1959, 15) says that Linguistics is a typical statistical science; the statisticians know this well; most linguists still ignore it. In the following we demonstrate that statistics and frequency based arguments are eminently suited for linguistics, but that frequencies and statistics need to be handled with some care.

1.6. 3 VIEWS ON STATISTICS

There are probably as many views on statistics in linguistics as there are linguists. Below I discuss three views that seem particularly relevant to the present study. These views can be categorized as follows:

(i) Statistics is potentially useful, but not very convenient or practical;

(ii) Statistics cannot as a matter of principle contribute to the goals of linguistics;

(iii) Statistics is useful, but should be limited to certain types of problems.

1. 6. 4 NEED FOR STATISTICAL STUDIES IN LINGUISTICS

The need for the statistics comes from the fact that there is variation in the numerical values associated with the data (i.e. the value over a set of measurements are not identical (Anthony, Paul & Arthu, 2003). If there were no variation, there would be no need for statistics.

Let us imagine that a psycholinguist is interested in finding the nature of aptitude for learning foreign languages. As part of this study 100 subjects are given a language aptitude test and after a period of language instruction, an achievement test in that language. One of the things the psycholinguist wishes to know is the form of the relationship between scores on the aptitude test and scores on the achievement test. Looking at the two sets of scores may give some clues: some one who scored exceptionally high on the aptitude test, for instance, may also have done exceptionally well on the achievement test, but the psycholinguist is not going to be able to assimilate all the information conveyed by the 200 scores simply by working at each pair of scores separately. However, there is a straight forward statistical technique available which will allow the strength of the relationship to be represented in a single value (the correlation). Here, the statistics serves the purpose of reducing complex data to manageable proportions. In this, they have concerned the performance of a sample of subjects. Of course, the ultimate interest of linguistic investigators is not in the performance only of samples. They usually wish to generalize the performance of larger groups.

Herden (1966:1) says 'linguistics is not possible without some degree of statistical classification'. He goes on to raise the question: 'How else than by patiently recording and classifying linguistic forms according to their functions, can we imagine that the grammar of a language was extracted from

the actual speech occurrences?' Hence, language related statistics has been developed into yet another branch of linguistics called Computational Linguistics and Statistical linguistics. Hence, linguists expect statistics to provide them the instruments or what are called the tools, for testing and verifying any conclusion, which is susceptible to numerical treatment.

The statistical analysis of Tamil morphological data is of use to the linguists in two different ways. Firstly, it enables one to have a deeper and fuller understanding of the Tamil morphological structure and functions of various morphological units. Secondly, this understanding emboldens one to make or desist from making any possible changes in the usage of these morphological elements. Any sign of shift in the characteristic features of morphological units such as morpheme, allomorph etc., may encourage a linguist to suggest modifications in the writing system. On the other hand, if any of these linguistic units exhibit unmistakable stability in their usage over a period of time, the linguist will have every right to warn language planners to desist from attempting any modification in the language usage in the name of reforms and language development.

Frequency studies of the morphological elements form the basis of any statistical investigation of a language. These frequency counts are normally based on running words – either spoken or written. The spoken Tamil varies largely from region to region and hence any study of the spoken Tamil would only be a restricted study of a dialect of Tamil. But the written form of Tamil has been standardized and hence a study based on written Tamil would necessarily be acceptable to all and would reflect the comprehensive and overall nature of the morphological units in Tamil. Moreover, a diachronic study of any language would have to be based on the written form only.

CHAPTER-2

TECHNIQUES AND TOOLS FOR THE ANALYSIS OF TAMIL MORPHOLOGY: METHODOLOGY

2. 1 INTRODUCTION

In this chapter, we discussed the techniques and tools used and the methodology that is adopted for the statistical analysis of Tamil Morphology based on the corpora. As a part of this, we would also discuss the quantitative aspects of the Tamil morphological elements too. This chapter is divided into five modules, each of which discusses (i) the statistical techniques and methods in language analysis; (ii) Getting ready with the resources for the study of Tamil morphology for the statistical analysis, which involves cleaning the texts and other related aspects which are used in the analysis of the corpus in addition to converting it into a convenient encoding system for our analysis; (iii) the hardware and the software that are used, the programming techniques and tools, etc.; (iv) the implementation, testing and evaluation. (v) The quantitative approach to Tamil morphology. These are discussed as in the following heads:

(i) Techniques and Methods,
(ii) Resources: The Corpora,
(iii) Programming Techniques,
(iv) Implementation, Testing and Evaluation,
(v) Quantitative approach to Morphology

As mentioned in the introduction of the first chapter, our main objective is to record the facts about the frequencies of affixes and stems as constituents of the word forms. First and foremost, a frequency list of word forms numbering

4,00,000 from a corpus of 3 million words of running texts. These words have been extracted from said corpora, and each word in the list is arranged in two columns, the first column consists of frequencies of words and in the second column, the word forms. For instance, a subset of the supplied Tamil word list or word forms looks like this:

1422 peṇ]$_{n.}$ + kaḷ]$_{n., pl}$ + ukku]$_{n, pl, dat}$ + ē]$_{n, pl, dat, emp}$

230 vā]$_{v.}$ + nt]$_{v, pst}$ + āḷ]$_{v, pst, 3sg.fem}$

278 pū]$_{n.}$ kkaḷ]$_{n, pl}$ + iliruntu]$_{n, pl, abl/psp}$

420 paṭi]$_{v.}$ + kkiṟ]$_{v, prs}$ + āṉ]$_{v, prs, 3sg. mas}$

461 maram]$_{n.}$ + kaḷ]$_{n, pl.}$

589 kāl]$_{n.}$ + kaḷ]n, $_{pl}$ + ukku]$_{n, pl, dat}$

723 kaṇ]$_{n.}$ + kaḷ]$_{n, pl}$ + ai]$_{n, pl, acc}$

77 pacu]$_{n.}$ + ai]$_{n, acc}$

There are a number of things to clarify about the above list: Each line of the list contains a root word separated from remaining portion its analysis (e.g., maram + kaḷ) by one or more plus symbols. The analysis displays morpheme labels separated by plus signs. In Tamil, for instance, in order to get a total score for any given word (root word) or a morpheme frequencies of all allomorphs shall be obtained and summed for totals. Therefore, it would be necessary to distinguish the allomorphs of the suffix "-kaḷ " (-kaḷ or -kkaḷ). Morpheme labels in the analysis are separated from each other by a space. This means that only grammatical categories that are realized as morphemes are included.

The morpheme labels that correspond to inflectional (and sometimes also derivational) affixes have been indicated within the closing brackets. (e.g.]+pl,]+pst). This is necessitated for the evaluation in addition to the requirements of overall performance statistics. Evaluation measures are also computed separately for the labels enclosed in brackets. It becomes easier to

make an approximate assessment of how accurately affixes vs. non-affixes are discriminated. When we use this kind of naming to the morphemes then quantification will be easily carried out. The morpheme labels that have not been marked as affixes (not enclosed in brackets) are typically stems. These labels consist of string, usually followed by an closing bracket ( ]) and a part-of-speech tag, e.g., ‘maram]n.’, ‘col]v’. In many cases, especially in Tamil, the same morpheme can function as different word classes; e.g., the Tamil word ‘paṭi’ which can function as noun or as verb when it is does not get inflected. But when it gets inflected then the inflectional affixes or the derivational affixes would tell whether it is belongs to a noun category or a verb category. For instance, the original word classes of the words "paṭikaḷil" (paṭi]$_{n.}$ + kaḷ]$_{n, pl}$ + il]$_{n, pl, loc}$)and “paṭikkiṟāṉ” (paṭi]$_{v.}$ + kkiṟ]$_{v, prs}$ + āṉ]$_{v, prs, 3sg.mas.}$) are a noun and a verb because of their inflectional suffixes that they inflected to. Thus both noun and verb inflections of “paṭi-kaḷ-il” and "paṭi-kkiṟ-āṉ" are contain the morpheme "paṭi".

The most frequent affixes of an analysis for a given word correspond to the list of labeled morphemes. Affixes of an analysis may consist of a list of unlabelled morphemic segments because of their ambiguous nature all such cases manual analysis will be performed to find out their actual identity. The method presented in this study simple since it labels the segments with general morpheme categories, which are detailed below.

Morpheme Categories

The morphemic segments discovered by the programme are labeled by one of the following categories: prefix (P), stem or base (B), suffix (S) and Sandhi or Morphophonemic changes (MC).

Example morpheme analyses

maraṅkaḷiliruntu = maram]$_{B}$ is a root/stem + ṅ]$_{MC}$ is a morphophonemic changes or sandhi + kaḷ]$_{pl}$ is a plural marker suffix + il]$_{loc}$ is a locative case marker suffix + iruntu]$_{abl/psp}$ is an ablative or postposition.
uzaikkiṟavaṉ = uzai]$_{B}$ is a verb root + kkiṟ]$_{prs}$ is a present tense suffix + avaṉ]$_{3sg.mas.}$ suffix or the whole form can be consider relative participle (RP) form.

Simple morpheme labeling, as it is done by using Perl and Shell programs, is a first step towards full-fledged morphological tags in the sense that morphological categories such as stem, suffix or prefix labels given by linguistic analyses. For instance, the morphological categories introduced by our method include the following morphological labels in Tamil:

Stem category B: word categories as noun (n), verb (v) adjective (adj.) pronoun (prn) and etc.
Suffixes category S: prefix P: such as *'a'*, *'i'* and *'e'* and including inflectional and derivational suffixes etc.

Accuracy of Morpheme Labeling

A further objective of morpheme labeling is to disambiguate cases of allomorphy. The recognition of allomorphy may not be a challenging work in case of supervised morpheme segmentation but it may be a challenging work for the system in the case of unsupervised morpheme segmentation but this may not be the case with semi supervised morpheme segmentation. For instance, distinction is made between the allomorphs of the Tamil plural suffixes + -kaḷ /+ -mār (-kaḷ, -kkaḷ) where the allomorphs belongs to different morpheme will always be recognized as morpheme, as shown by the following examples:
appaḷḷi**kaḷ**il = a]$_{dem}$ + paḷḷi]$_{dem, n.}$ + kaḷ]$_{dem, n, pl}$ + il]$_{dem, n, pl, loc}$

immaraṅ**kaḷ**ai = i]$_{dem}$ + maram]$_{dem, n.}$ kaḷ]$_{dem, n, pl}$ + ai]$_{dem, n, pl, acc}$

eppū**kkaḷ**ukku = e]$_{dem}$ + pū]$_{dem, n.}$ + kkaḷ]$_{dem, n, pl}$ + ukku]$_{dem, n, pl, dat}$

The morpheme *paṭi* is ambiguous: it can be a noun 'step' and can be a verb 'read' or even a 'measure'. The morpheme *paṭi* is correctly labeled as a stem in the words. When the same morpheme occurs at the beginning of a word, it is always labeled as a stem, as in paṭikaḷil (paṭi]$_{n.}$ + kaḷ]$_{n, pl}$ + il]$_{n, pl, loc}$)

The above analysis is obtained through the techniques laid down in the 2.1. This procedure takes a list of words or list of words with frequency as input and returns a list of labeled morphemes for each word. Morphological segmentation are obtained using the above techniques.

2. 1. (I) TECHNIQUES AND METHODS

As we mentioned earlier this method first takes input file as words with frequency information as base and gets the output as prefix, stem and suffixes. The output is a labeled segmentation of the input words. Labels belong to one of the following categories: prefix, root/stem and suffix morphophonemic variants. The procedure can be divided into four main steps.

STEP 1: Retrieving of Prefixes

The objective of step 1 is to acquire a list of prefixes. All the words in the input word list are segmented based on the prefixes. We consider these *a*, *i* and *e* (demonstrative base) are prefix for the computational purpose. This idea is frequent in research on the segmentation of words into morphemes. One morpheme boundary is identified in this word, which corresponds to the following segmentation:

a+nīti+kaḷ+ukku which means "To injustices"

a]$_{dem}$ + nīti]$_{dem, n.}$ + kaḷ]$_{dem, n, pl}$ + ukku]$_{dem, n, pl, dat}$

a+cuttam+kaḷ+il which means "In lack of cleanliness"

a]$_{\text{dem.}}$ + cuttam]$_{\text{dem, n.}}$ + kaḷ]$_{\text{dem, n, pl}}$ + il]$_{\text{dem, n, pl, loc}}$

a+jīraṇam+tt+āl which means "by indigestion"

a]$_{\text{dem.}}$ + jīraṇam]$_{\text{dem, n.}}$ + tt]$_{\text{dem, n, obl}}$ + āl]$_{\text{dem, n, obl, ins}}$

a+v+viḷ aiyāṭṭu+il which means "In that game"

a]$_{\text{dem.}}$ + viḷaiyāṭṭu]$_{\text{dem, n.}}$ +il]$_{\text{dem, n, loc}}$

e+v+virutu+kku which means "To which award"

e]$_{\text{dem}}$ + virutu]$_{\text{dem, n.}}$ + kku]$_{\text{dem, n, dat}}$

Loanwords from Sanskrit are not productive and they are not created new forms.

STEP 2: Retrieving of Stems

The aim of this step is to retrieve a list of stems, using the prefixes and suffixes. By stripping off from each word in the input word list all the possible combinations of prefixes, suffixes to get the bear stem or a root (simple or complex).

a+p+***paḷḷi***+kaḷ+il which means "In those schools"
a]$_{\text{dem}}$ + ***paḷḷi]***$_{\text{dem, n.}}$ + kaḷ]$_{\text{dem, n, pl}}$ + il]$_{\text{dem, n, pl, loc}}$

e+p+***paṭam***+ṅ+kaḷ+il which means "In which pictures?"
e]$_{\text{dem}}$ + ***paṭam]***$_{\text{dem, n.}}$ + kaḷ]$_{\text{dem, n, pl}}$ + il]$_{\text{dem, n, pl, loc}}$

i+p+***paiyaṉ***+kaḷ+il which means "In these boys"
i]$_{\text{dem}}$ + ***paiyaṉ]***$_{\text{dem, n.}}$ + kaḷ]$_{\text{dem, n, pl}}$ + il]$_{\text{dem, n, pl, loc}}$

STEP 3: Retrieving of Suffixes

The objective of step 3 is to acquire a list of suffixes. All the words in the input word list are segmented based on the suffixes. Morpheme boundaries are identified in the following words, which correspond to the following segmentation:

a+p+paḻḻi_***kaḷ+il*** “In those schools”
a]$_{dem}$ + paḻḻi]$_{dem, n.}$ + ***kaḷ]***$_{dem, n, pl}$ + ***il]***$_{dem, n, pl, loc}$

i+p+paiyaṉ+***kaḷ+il*** “In these boys”
i]$_{dem}$ + paiyaṉ]$_{dem, n.}$ + ***kaḷ]***$_{dem, n, pl}$ + ***il]***$_{dem, n, pl, loc}$

e+p+paṭam+ṅ+kaḷ+il “In which pictures”
e]$_{dem}$ + paṭam]$_{dem, n.}$ + ***kaḷ]***$_{dem, n, pl}$ + ***il]***$_{dem, n, pl, loc}$

STEP 4: Identification of Morphophonemic Process

The purpose of step 4 is to identify an array of morphophonemic changes. All the words in the input word list are segmented based on the morphophonemic changes which are called as Sandhi. Morpheme boundaries are introduced in this word, corresponding to the following segmentation:

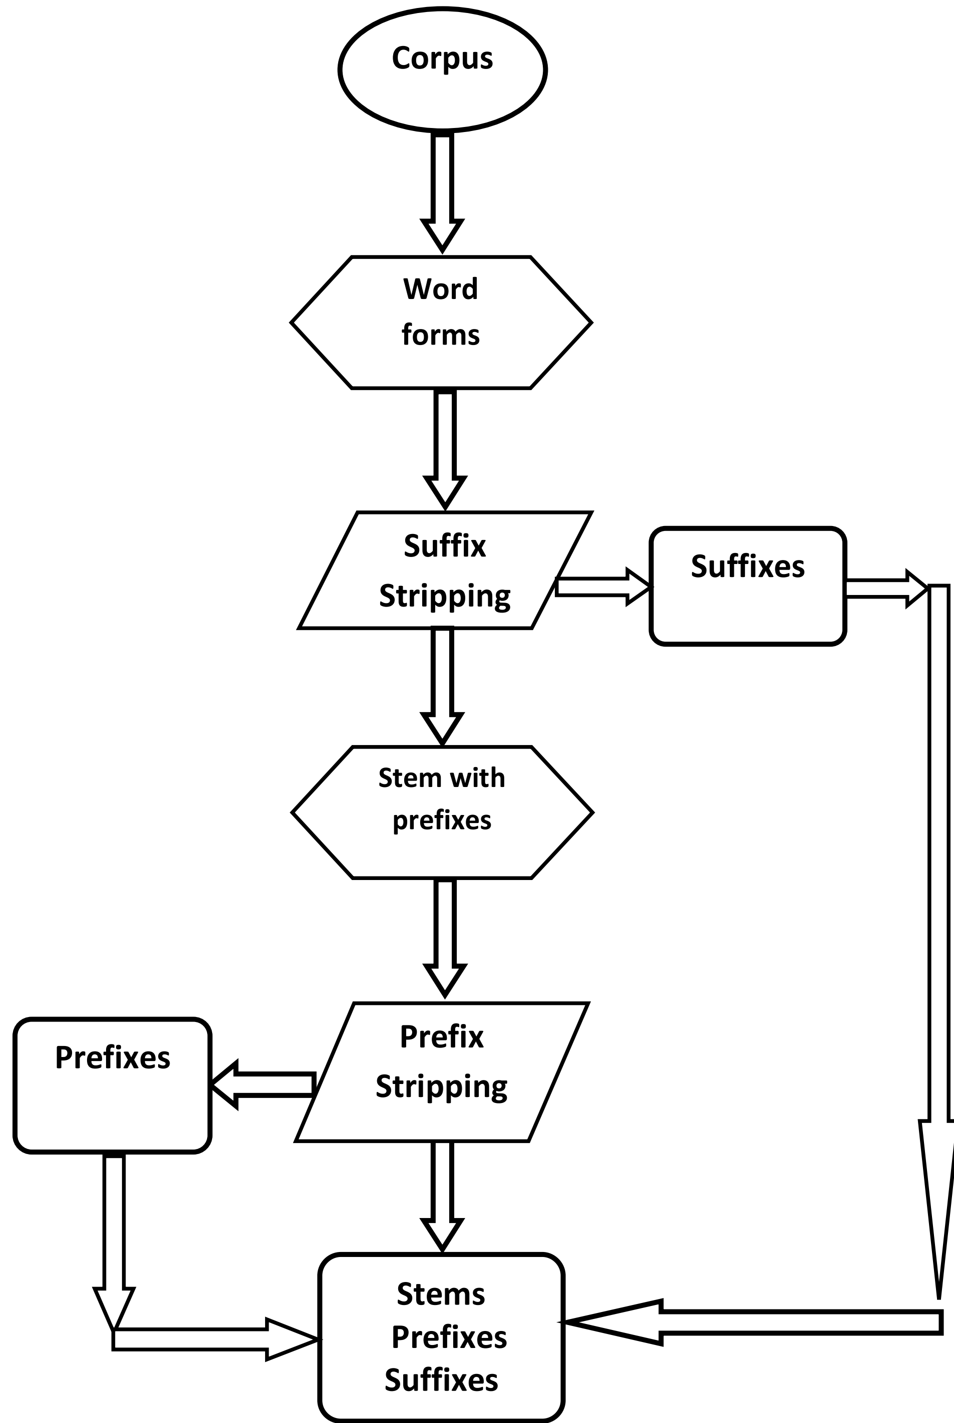

a+***p***+paḻḻi_kaḷ+il “In those schools”
a]$_{dem}$ + **p**]$_{mc}$ + paḻḻi]$_{dem, n.}$ + kaḷ]$_{dem, n, pl}$ + il]$_{dem, n, pl, loc}$

i+***p***+paiyaṉ+kaḷ+il “In these boys”
i]$_{dem}$ + ***p]***$_{mc}$ + paiyaṉ]$_{dem, n.}$ + kaḷ]$_{dem, n.pl}$ + il]$_{dem, n.pl, loc}$

e+***p***+paṭam+ṅ+kaḷ+il “In which pictures”
e]$_{dem.}$ + ***p]***$_{mc}$ + paṭam]$_{dem, n.}$ + ***ṅ]***$_{mc}$ + kaḷ]$_{dem, n, pl}$ + il]$_{dem, n, pl, loc}$

Once a word has been segmented in this way, the proposed segment is identified as an affix in wordlist and at least once at the beginning of a word. The identified prefix is then is retrieved for statistical study. All the strings preceding this stem in the input wordlist are added to the list of prefixes since they are less frequent than the stems. Correspondingly, all the substrings following this stem in the wordlist are added to the list of suffixes they are frequent than the stem. All the substrings that may precede or follow the stem in the wordlist are added to the list of morphophonemic variants.

2. 1. 1 A Flowchart for the Segmentation of Words

FLOW CHART

2. 1. 2 Frequencies

Frequency-sorted word lists have long been part of the standard methodology for studying corpora. Sinclair (1991:30) states, Anyone studying a text is likely to need to know how often each different word form occurs in it. Tribble and Jones (1997: 36) outline a pedagogical methodology for using texts in the language classroom, proposing that the most effective starting point for understanding a text is a frequency-sorted word list. The frequency list records the number of times each word occurs in the text; it can provide interesting information about the words that appear (or do not appear) in a text. The list can be arranged in an order of first occurrence, alphabetically or in the order of frequency. First-occurrence order serves as a quick guide to the distribution of words in a text, an alphabetic listing is built mainly for reference, but a frequency-ordered listing highlights the most commonly occurring words in the text. For example, Juilland produced a series of frequency dictionaries for Spanish, Rumanian and French 1965 and 1970). Even the more traditional dictionaries can make use of frequency information. The texts on which the American Heritage Word Frequency Book (Carroll et al, 1971) was built formed the citation base for the American Heritage School Dictionary. Recently the LDC-IL produced a frequency dictionary of 5,000 distinct words for some of the Indian languages (LDC-IL report 2009).

Francis and Kučera (1982) take the simple word frequency list one stage further by reporting *grammatical word* frequencies. This gives frequencies of words with their associated part-of-speech (POS) tags in the (tagged version of the) Brown corpus. The frequency profile for a given text can be compared to that of other similar texts or to that of large bodies of text. Since the high frequency items tend to have a stable distribution, generally, significant changes to the ordering of the words in the frequency list can flag items of interest to the researcher (Sinclair 1991:31). Such techniques can be carried out manually for a small corpus but otherwise we need the aid of a

computer program. Although the computer saves us time with its processing of the texts into frequency lists, it presents us with so much information that we need a filtering mechanism to pick out significant items before the analysis can proceed. Hofland and Johansson (1982) use Yule's K statistic and the chi-squared goodness-of-fit test in their comparison to pick out statistically significant different word frequencies across British and American English. Various formulae can be applied to adjust the raw frequencies for the distribution of words within a text, or to describe the dispersion of frequencies in subsections of a corpus.

Frequency profiling is one of the two main methods in corpus linguistics, the other being the use of concordance lines. A set of concordance lines presents instances of a word or phrase usually in the centre, with words that come before and after it to the left and right. The frequency of morphemes and words and their ngram techniques (bigram, trigram) would have crucial role in enhancing the NLP applications such as POS tagger, Machine Translation, Word Sense Disambiguation, Spell Checker and so on.

An important step in corpus processing is to convert the running text into a list of words and their frequencies. The program Splt_txt_to_wrds.pl takes a file as input, breaks it into individual words using space and punctuation as delimiters, and gives us output in terms of words and their frequencies. The program Splt_txt_to_wrds.pl is one of the most useful programs frequently used in the corpora analysis.

2. 1. 3 N-gram Methods

What is an n-gram?

An n-gram is a contiguous sequence of n items from a given sequence of text or speech. The items in question can be phonemes, syllables, letters, morphemes, words or base pairs according to the application. N-grams are

collected from a text or speech corpus. An n-gram of size 1 is referred to as a 'unigram', size 2 is a 'bigram', size 3 is a 'trigram'. Larger sizes of n-grams are sometimes referred to 'four-gram', 'five-gram' and so on. An n-gram model is a type of probabilistic language model for predicting the next item in such a sequence in the form of a (n-1) order Markov model. N-gram models are now widely used in probability, communication theory, computational linguistics (for instance, statistical natural language processing), computational biology (for instance, biological sequence analysis), and data compression.

The idea of word prediction; what word, for example, is likely to follow the following sequence of words.

...viraivil araciyal caṭṭa tiruttam koṇṭuvara villai.... 'Quickly they did not bring amendment to the constitution'

Hopefully most of you have concluded that a very likely word is *vēṇṭum*, or *koṇṭuvarappaṭum* or *koṇṭuvarappaṭalām*, but probably not *the*. We formalize this idea of word prediction with probabilistic models called N-grams, which predict the next word from the previous N-1 words. Such statistical models of word sequences are also called language models. Computing the probability of the next word will turn out to be closely related to computing the probability of a sequence of words. The following sequence, for example, has a non-zero probability of appearing in a text:

…nēṟṟu tiṭīr eṉṟu eṉakku oru pōṉ vantatu… 'Suddenly a phone call came to me yesterday'

while this same set of words in a different order has a very low probability:

....vantatu pōṉ tiṭīr nēṟṟu oru eṉṟu eṉakku...' To me one phone yesterday suddenly came'

As we will see, estimators like N-grams that assign a conditional probability to possible next word can be used to assign a joint probability to an entire

sentence.

An n-gram is an ordered sequence of two or more adjacent words, characters, or morphological elements separated by space. The idea of n-grams (in terms of bigrams and trigrams) are often used in studies in NLP. N-gram is the information of the association between n number of events. In order to build morpheme-based or word-based NLP tools the data sets are decomposed into their morpheme components. Therefore such an analysis requires every word is split into zero or more elements or zero or more prefixes followed by a stem (simple or compound) followed by zero or more suffixes.

2. 2. (II) RESOURCES: THE CORPORA

The tasks that are listed in the Aims and Scope of the study require that it shall be based on corpora of considerable size. For this study, we used the corpora of CIIL, EMILLE and Tamil BIBLE text for our research purpose. The CIIL corpus is analyzed first to find out exhaustive enumeration of various morphological categories. This is the basic resource for the study and understanding of Tamil morphology used in Modern Tamil.

We have also used the Tamil corpora of about 20 million words created by incorporating corpora of CIIL, Mysore and Lancaster University, UK and the Bible Society of India (ref. Paul Baker et al. 2003). The EMILLE-CIIL monolingual written corpora filenames in the written corpus consist of codes for the language and text type followed by a word to specify the source of the data, possibly followed by a subcategory. At the end of the filename is the date of publication of the original text (in the case of news data) or a code number (for other files). This is the main source for the study of frequencies of character level n-grams study.

These corpora, originally encoded as ISCII text, have been converted to Unicode with CES-compliant SGML markup language (cf. EMILLE Project).

The filenames of texts from the CIIL Corpus differ slightly from those of the overall scheme. Because the CIIL Corpus was drawn from a much wider set of genres, the EMILLE Project's data, it was not considered suitable to classify them by source. Instead they are classified by genre (category and subcategory). The filename is concluded by the code identifying that file in the original CIIL Corpus. Within the corpus structure these files are grouped in a directory entitled "miscellaneous" (because the data derives from a wide miscellany of sources). We have not included the directory entitled miscellaneous which is not cleaned but the same files we used (CIIL corpus) which are cleaned and converted into Unicode available at CALTS Language Technology Lab, Centre for Applied Linguistics and Translation Studies, University of Hyderabad.

The EMILLE-CIIL Monolingual Written Corpora have a total size of approximately 19,980,000 million words. Usually reliability of the statistical facts of a corpus depends on its size. In fact, the true reliability proportionately increases with the increasing size of the corpus (Xiao, Z., McEnery, A. et al 2004). The efforts in building large sized corpora for our Indian languages are yet to begin. However, the frequencies are relatively reliable for the most common members of words in the corpus .

2. 2. 1 CIIL Corpus

The Tamil corpus developed at CIIL (cf. Ganasen, M (1999)) is based on more or less proportionate distribution of texts appearing in print in various genres. Therefore the outcome of the study of this corpus is applicable to Modern Standard Written Tamil. The samples of texts belong to eight larger groups of genres as in the following:

1. **Aesthetics:** This contains texts of literature viz., novel, short–stories, essays, criticism, humour, children's literature, biographies, travelogues, letters,

speeches, plays, science fiction, folk-tales and text books. The texts in Aesthetics contain 190 files.

2. **Fine Arts:** This contains texts of music, dance, sculpture and hobbies. The texts in fine arts have 36 files.
3. **Social Sciences:** This group of texts contains sociology, linguistics, psychology, anthropology, history, epigraphy, political science, home-science, public-administration, catering-technology, religion, philosophy, economics, logic, journalism, folklore, mythology, law, astrology, criminology, yoga, health, sexology, culture, sports & games, personality, anecdote, tailoring and text of the relevant text books. The whole social science group contains 310 files. This is the one which contains more files but not many words.
4. **Natural and Physical Sciences:** This includes texts from botany, zoology, geology, microbiology, physics, computer-science, astronomy, medicine, ayurveda, engineering, oceanography, agriculture, veterinary, film technology, marine biology, fisheries and the texts from relevant text books. This group of texts contains 135 files.
5. **Commerce:** This group contains texts of business management, industry and handicraft. The text in this group contains 6 files.
6. **Official & Media Language:** This group contains of Legal, Administration and Mass media Texts. This group contains 56 files.
7. **Translation Material:** This is a mixture of all groups because this contains collection of translated texts. This includes texts from Literature, Psychology, Legal, Philosophy and Education. The translated materials contain 18 files.
8. **Spoken Tamil:** This is the one, which does not belong to any of these groups. This contains 8 files. Data from the CIIL Corpus include is 3, 050, 360 (30 lakhs) words of running texts.

The Tamil corpus that is used in this study is developed by CIIL and funded by the Ministry of Information Technology. It contains 3 million words of

modern written Tamil. The text materials belong to different years, mostly published during the period of 1980's and early 1990's. The texts include mostly written texts as well as a small portion of transcribed spoken texts. The samples of texts belong to eight genres as mentioned above.

2. 2. 2 EMILLE Corpus

The EMILLE corpus is a news corpus which is developed from the daily news paper Dinakaran. The Tamil EMILLE corpus also contains data incorporated from the CIIL Corpus, originally gathered by the Institute. The contents of the Tamil written corpus are as follows (broken down by directory): Data from the Dinakaran website, divided into five parts such as Cinema, News, Politics, Sports and Other. The *Cinema* contains film and related news (approximately 1,050,000 words) and The *News* contains news stories (approximately 8,610,000 words) and The *Politics* bears political news and commentary (approximately 5,050,000 words) and The *Sports* contains sports news reportage (approximately 1,170,000 words) and finally the directory *Other* contains other stories from the website (approximately 730,000 words) The Tamil written corpus altogether contains a total of approximately 19,980,000 words.

2. 2. 3 BIBLE Text Corpus

The Bible consists of a collection of sixty-six separate books. It has broken into two major sections: The Old Testament which consists of thirty-nine books, and The New Testament which consists of twenty-seven books. It has altogether 1189 chapters both in the Old Testament and the New Testament. The Bible text corpus contains a total of approximately 4,25,000 words.

2. 2. 4 Encoding Standards

The encoding standard that was used is ISCII (ISO 1988/1993) the Indian Script Code for Information Interchange. All the Indian scripts that are derived from the Brahmi script share this encoding. For this purpose an

optimal keyboard is made. There are manifold advantages in having a common code and keyboard for all the Indian scripts. The ISCII standard specifies a code table which can be used in 7 or 8-bit code (ISO compliant) environment. It allows Latin/roman and Indian script alphabets to be used simultaneously. The ISCII text requires a Tamil font in order to be displayed in Tamil for reading and processing. However, we have chosen for the internal processing the Roman notation (wx-notation) for the purpose of easy processing. WX-notation is an extremely convenient roman transliteration scheme for all Indian languages. It is more or less 'phonetic roman' except for a small number of roman characters. This scheme is characterized by the use of the characters w-x for dental stops, hence the name WX-notation. There are a number of advantages using the text in WX-roman notation, since it follows a strictly Tamil orthographic scheme, which is near phonemic in nature. It is easy to convert from this roman transliteration to ISCII and display it in Tamil at the stroke of a button on the keyboard.

2. 3. (III) PROGRAMMING TECHNIQUES

To analyze the corpora, we used Linux/Unix tools, which are readily available in the Linux environment. We have used a number of programs written in PERL which are developed and available at the CALTS Language Technology Lab and adopted for this study with some minor changes. Here are the tools used for the present study.

2. 3. 1 Linux/Unix Tools for Analyzing Corpora

As it was mentioned above, we have used Linux/Unix tools for analyzing the Tamil corpora. Linux/Unix tools viz. **cut**, **paste**, **grep, sort**, **wc**, etc. can be used in executing a number of functions plus a set of options while executing these. **Vi-editor** has been extensively used to see the intermediary stages of processing and for some minor editing requirements. Here is a list of certain

tools and commands on Linux, which are useful in the current study of the Tamil corpora:

Cut

The cut command is used to split a file vertically to manipulate fields. It is a powerful text manipulator often used in combination with the other commands or filters. A character, a space, a punctuation mark can be used to delimit the field. It is an extremely useful command to manage contents of files to swap the fields, words and frequencies into frequencies and words etc. As an example: the command cut –c –d, -f2 <input file> f2.out, extracts the second field (f2) from the input file and puts in f2.out.

Paste

This command is used to create a file by combining one or more files vertically containing one or more fields. What one can cut with *cut* can be pasted back with the paste command but vertically rather than horizontally. The command paste also uses the tab as the default delimiter as cut uses. The syntax of this command is –

paste file1 (input) file2 (input) > file3 (output)

Grep

The grep command is generally used to extract a sequence of one or more strings of one or more files from one or more directories. This is one of the most important UNIX commands and it looks at its input for a pattern and displays lines containing the pattern, the line numbers or filenames where the pattern occurs. This command is extremely useful for checking a particular word or a linguistic unit from one or more files of the entire corpus. The syntax for the execution of this command is –

grep 'pattern' <input file> output file.

Sort

The sort command is generally used for sorting strings of one or more characters distributed over a number of lines in the desired way. This command is used for ordering of data in ascending or descending sequence. Like cut, it identifies fields and it can sort on specified fields. It can also be used with a number of optimal features. For this, the syntax is –

sort –n –d –r < input > output sorted file

(Where n= numerical, d= dictionary and r= reverse order).

wc

Unix features a common word-counting program that also counts line and characters. The wc command counts lines, words, and characters in a given file. For this, the syntax is – wc filename

Vi-editor

The vi-editor is a screen editor, which is one of the most powerful text editing tools available in Linux/Unix environment and can be conveniently used simultaneously to display ISCII text in an Indian script using a Gist Terminal. Vi- editor can be used as a multilingual editor on GIST terminal.

Shell

As Victor Gedris (2003) states that Shell is a program that interprets commands and allows a user to execute commands by typing them manually at a terminal, or automatically in programs called shell scripts. A shell is not an operating system. It is a way to interface with the operating system and run commands.

Unix uses shells to accept commands given by the user, there are quite a few different shells available. The most commonly used shells are

SH(Bourne SHell) CSH(C SHell) and KSH(Korn SHell), most of the other shells you encounter will be variants of these shells and will share the same syntax, KSH is based on SH and so is BASH(Bourne again shell). TCSH(Extended C SHell) is based on CSH.

The Basic Shell Commands are **ls** - list files in current directory, **cp** - srcfile destfile copy file "srcfile" to new file "destfile", **mv** - oldname newname rename (or move) file "oldname" to "newname", **rm** - myfile remove file "myfile", **mkdir** - subdir make new directory "subdir", **cd** - subdir change current working directory to "subdir" **rmdir** - subdir remove (empty) directory "subdir", **pwd** - display current working directory, **date** - display current date and time of day, **man command** - display man page for "command", **exit** - exit a terminal window, **logout** - logout of a console session and etc.

Perl Programs

Perl is an acronym for "Practical Extraction and Reporting Language". It is used as a scripting language and as an efficient string manipulating language using the regular expression. It incorporates syntax elements from the Bourne shell, csh, awk, sed, grep etc. Here, for the current purpose, we have used various programs written in PERL to perform various tasks such as extracting individual words from running texts from various files, counting frequencies of words, morphemes, characters and their bigram, trigrams have been extracted from word forms etc. and calculating the percentages along with probability of the various units. In the 3rd chapter the cursory details of some of the programs and their functions are presented.

2. 4 (IV) IMPLEMENTATION, TESTING AND EVALUATION

Segmented Words

In the final step, all the words are segmented. Word segmentation is performed by comparing words which contain the same stem to one another. This consists finding limits between shared and different segments and results in a segmentation of the words being compared. The outcome can be represented as an alignment graph for each stem. Figure-1 depicts the alignment graph obtained for the words containing the Tamil stem *maram*.

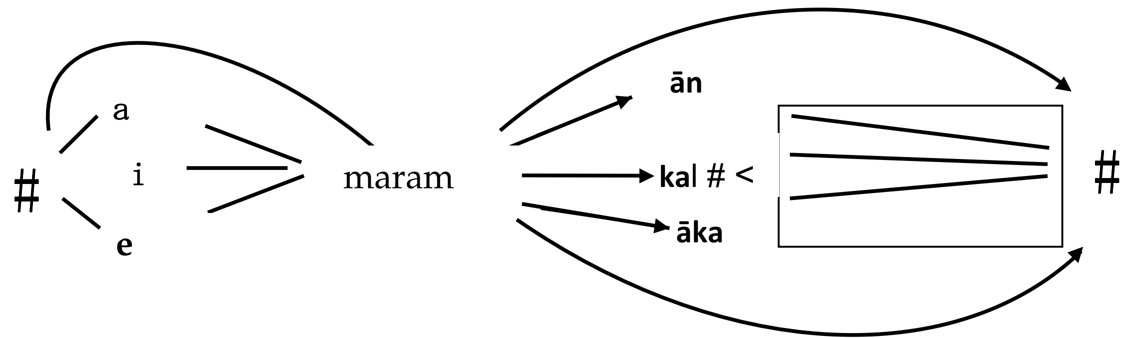

Figure-2: Exemplifies segmentation of words sharing the stem/root *maram*

Segments are subsequently labeled with one of the four labels (prefix, suffix, stem, morphophonemic change) according to their positions within the word, relatively to the stem. All the segmentations are made up of valid morphemic segments.

The method involves both the determination of the correct morphological split for individual words, and the establishment of accurate categories of stems based on the range of suffixes:

TECHNIQUES AND TOOLS FOR THE ANALYSIS OF TAMIL MORPHOLOGY

1. **Splitting words**: We try to accurately analyze any word into its successive morphemes in a fashion that corresponds to the traditional linguistic analysis. Minimally, we identify the stem, as opposed to any inflectional suffixes. Ideally we would also identify all the inflectional suffixes in a word which contains a stem that is followed by two or more inflectional suffixes, and we would like to identify derivational prefixes and suffixes. We would like to state that in these corpora, the most important suffixes are -il, -kaḷ, -ai, -kku, -iṉ, -ukku, -iṭam, -kkaḷ, -uṭaṉ, -āl, -ukkāka, -ōṭu, -iliruntu and so on.

2. **Range of suffixes**: The most important characteristic of a stem in the language that we consider here is the range of suffixes with which it can appear. Nouns in Tamil, for example, will appear with some subset of the suffixes or suffix complexes kaḷ, kkaḷ, ṅkaḷ, mār, kaḷai, kaḷukku, kaḷōṭu, kaḷukkāka etc. We would like to determine what is the range of the most regular suffix groups for the morphology of the language in question, and rank suffix groupings by order of frequency in the corpora. In addition, one would like state general rules of allomorphy as well; for example, a statement that the stems mara and marat (as in maraṅ-kaḷ and mara-tt-il, respectively) are forms of the same morphological stem *maram*.

2. 5. (V) QUANTITATIVE APPROACH TO MORPHOLOGY

The present study attempts to reveal the statistical facts of morphological units, their distribution and their relevance in building NLP tools. It also helps to find out the characteristic patterns of the Tamil morphological elements. Quantitative analyses of corpora provide comprehensive approaches in understanding complexity of the morphology of the language. The study involves the analysis of the corpora to find out the frequencies of Tamil morphological units viz. prefixes, stems, suffixes and other various morphological entities, their distribution, comparison and the linguistically relevant interpretation based on these. In a way it lays focus on

the frequency occurrence of morphemes and words and their coverage, and their bigramic, trigramic probabilities associated with the relevant categories. Most frequent affixes and their variants, most frequent patterns in combination, most frequent allomorphs, most frequent stems/roots, frequencies of morphophonemic changes, most frequent character combinations of two to three, the relevance of their frequencies with respect to their allomorphy and their distribution in the corpora will be discussed. Finding out the frequencies of certain morphological types and categories over other may reveal a number of facts about the morphology. The corpora study would reveal both qualitative and quantitative aspects of Tamil morphology. Quantitative tools are a vital source in examining and exploring the importance of corpora with immense speed and accuracy to get near exhaustive information related to words, which is of great importance in building morphological tools. Our interest is to find out the properties of various morphological units, in terms of their quantity with respect to similar others. We propose to find summaries of arithmetical counts and their probabilities of each morphological unit in terms of frequencies, percentages and cumulative percentages, to illustrate their coverage to the whole corpora. The outcome of this study would enhance the development of NLP applications, but also in a greater way to understand the morphology of Tamil.

CHAPTER 3

FREQUENCY OF TAMIL MORPHOLOGICAL ELEMENTS

3. 0 INTRODUCTION

Before one can embark upon discovering the facts about the morphology of any language, it is usually a good idea to discuss the scope of the topic. The basic question arises in our mind is, what is a word and how do you know when you have got one? This notion seems so simple that, at the first glance, it does not require any strict definition or further explanation: one can think that a word is just a substring of the text as a letter string, from the first delimiter (usually, a space) to the next one (usually, a space or a punctuation mark (Uma Maheshwar Rao (2006). Nevertheless, the situation is not so simple. Let us consider the Tamil sentence *oru ūril oru rājā iruntār* (one king was in a town). How many words does it contain? One can say five and will be right, since there are just five letter substrings from one delimiter to another in this sentence. One can also notice that the adjectival ordinal form *oru* is repeated twice, so that the number of different words (substrings) is four.

We agree that the term *word* is too ambiguous to be used in a sense with the objective of giving a precise description of a natural language. To introduce a more consistent terminology, let us call an individual substring used in a specific place of a text (without taking into account its possible direct repetitions or similarities to other substrings) a *word occurrence*. Now we can say that the sentence above consisted of four word occurrences.

One thing that most people would certainly agree on is that Tamil words (as words in any language) consist of one or more morphemes. A good starting point for a discussion of Tamil morphology is a definition of the morpheme. At a first glance, one might be tempted to think that this, at least,

has a simple answer: a morpheme is something that is written with one or more characters.

As we know that, the analysis of word is important task in many natural language processing to build morphological analyzer, morphological generator, part-of-speech tagging, word sense disambiguation, machine translation, word grammar etc. In many languages, words are a combination of smaller meaning bearing units referred to as morphemes. The act of separating a word into its morphemes is called as morphological segmentation. The morpheme segmentation attempts to find out morpheme within the word forms. The identified morphemes can be used to produce grouping of word forms of the same lemma with a quite high precision. These morphemes can be classified into prefixes, stem/root and suffixes as we have seen in the first chapter (see figure-1).

3. 1 CORPUS BASED MORPHOLOGICAL STUDY

Let us see how corpora are used in studying the morphological phenomena and their productivity. We may consider what corpora of texts can tell us about the morphology of Tamil.

One thing that such corpora can give us a clue to how strongly a sequence of morphemes coheres as a unit, or in other words how strongly sequences of morphemes (and words) are associated with one another. While such information does not automatically tell us that the sequence is a word, it at least gives us a clue that perhaps the sequence in question is a lexical item and their measures of association.

We can also examine the productivity of morphological processes. Tamil has a number of plentiful productive suffixes. We will show that intuitions about productivity often have a statistical interpretation that can be derived from the distribution of words of a particular morphological class in the corpora. Finally, corpus-based statistical approaches have a practical

application in various natural language processing tasks. In the case of Tamil, one important such application is word segmentation.

3. 1. 1 MEASURES OF MORPHOLOGICAL PRODUCTIVITY

One of the most interesting results of work on corpus-based studies of morphology over the past decade or so has been the development of robust measures of morphological productivity; Baayen and his colleagues have done much of this work.

Various measures of morphological productivity have been proposed in the literature. One measure, due to Aronoff (1976), and discussed in (Baayen, 1989) is $\frac{V}{S}$ ined as: (1.) I= where *V* is the number of distinct instances of a morphological category — e.g., all words in English dictionary ending in the suffix *–ness* and *S* is the number of *potential* types of that category. The idea, clearly, is that if an affix, say, is productive, one will find that a lot of the formations that the affix might potentially form will in fact be found.

The problem of course is to measure *V* and *S*. *V* which cannot be measured simply by counting the words of a given morphological category that are found in a dictionary: as Baayen observes, dictionaries are typically unreliable indicators of what words are there in the language, particularly when it comes to productive formations: it is not worth the space or time to develop long lists of entries for words where the formation is predictable and therefore presumably known to the (native) reader anyway. One might of course measure *V* by counting the types of a given category found in a corpus, but still one is likely to miss valid instances that simply fail to occur in the corpus. It is even more unclear how to estimate *S*: the English suffix *-ness*, would seem to be able to attach to any adjective, so one might reasonably calculate *S* by first computing the number of adjectives (ignoring for the sake of argument the fact that this itself is hard to estimate). But what about a (seemingly less productive) the adjectival-noun forming affix *-ity*. Is *S* to be

computed under the assumption that *-ity* attaches to any adjective? Perhaps we should take into account the fact that *-ity* seems to attach almost exclusively to Latinate adjectives and lower our estimate of *S*. But then what about *-th*, as in *width*, or *breadth*? This is evidently a very unproductive affix in English, but on what basis do we draw that conclusion: perhaps *-th* is legitimately restricted to the set of native monosyllabic adjectives that denote physical properties, a very small set. In that case the measure
$\frac{V}{S}$ might actually be somewhat large.

A measure that turns out to be reasonable in that it has a well-defined method of computing, and accords with intuition as well as more rigorous psychological measures of productivity is that given in Baayen, 1989; Baayen and Lieber, 1991. Here *N* is the number of *tokens* of a particular construction found in a particular corpus: for example, the number of tokens of all nouns ending in *-ation*. The term n_1 represents the number of hepax legomena, the types of that construction that are represented in the corpus by a single token.
(2.) $P = \frac{n_1}{N}$ This measure is the same as what Church and Gale (1991) call the 'Good-Turing' Measure, and originates in work of Good (1953) on population biology. *P* is actually an estimate of the probability that the next token that we see of a particular construction will be one that we have never seen before. We may count empirical probability and percentage based on

$$P(E) = \frac{\text{Number of favorable outcomes}}{\text{Total number of outcomes}} = \frac{n(E)}{n(S)}.$$

3. 2 TAMIL MORPHOLOGY: AN INTRODUCTION

Tamil is a morphologically rich and complex language. A corpus-based study of morphology will be an interesting task for highly morphologically complex languages. As we mentioned earlier the morpheme analysis is the task of segmenting a word into morphemes such as prefixes, stems and

suffixes. The learning of morphology and obtaining their affixes requires linguistic and a bit of statistical knowledge to get their probabilities along with percentage based on the corpora. The objective of this statistical study is the morphological analysis, involving measuring the number of morphemes and their distribution in the language. This study is based on around 3 million word corpus.

In Tamil, words are morphologically complex and consist of a lexical root to which one or more affixes are attached. In a majority of the cases in the morphology of Tamil, affixes are suffixes. In Tamil, suffixes can be inflectional as well as derivational suffixes. Noun can be inflected for plural, oblique, case (direct/oblique), postpositions and clitics. Verbs can be inflected for aspect, voice, mood, tense and PNGs. To analyse such inflectionally rich languages, the root and the morphemes of each word have to be identified. There is no absolute limit on the length and extent of agglutination, which can lead to long words with a large number of suffixes, which would require several words or a sentence in English. To give an example, the word *appaiyaṉkaḷukkumaṭṭumētāṉāṭi* means 'Is it for those boys one and only?', and consists of the following morphemes:

a	= a prefix/demonstrative base/proclitic
p	= morpholophonemic increment or filler
paiyaṉ	= 'boy', the root
kaḷ	= 'plural'
ukku	= 'dative case marker'
maṭṭum	= only
ē	= emphatic clitic
tāṉ	= emphatic clitic
ā	= interrogative clitic
ṭi	= vocative clitic

The concept of morphemes and morphs for the formal procedures of decomposing words see the example in Tamil, the words *kaṇkaḷ* and *pūkkaḷ* the meaning of the respective words can be decomposed into two parts: reference to a class of eyes and flowers, the same that is referred to by the words *kaṇ* and *pū*, and reference to plural number. The form of the word *kaṇkaḷ* and *pūkkaḷ* can likewise be decomposed or segmentized into two parts: *kaṇ* + *kaḷ* and *pū* + *kkaḷ* respectively. Hereby a distinction is made between lexical and grammatical morphemes. Thus, the words *kaṇkaḷ* and *pūkkaḷ* consist of two morphemes each: the lexical morpheme *kaṇ* and *pū* and the grammatical morphemes denoting plural number viz. *kaḷ* or *kkaḷ*. On the other hand, the parts of the phonemic shapes of the words are referred to as morphs. Thus, the word forms *kaṇkaḷ* and *pūkkaḷ* consists of the morphs *kaṇ* + *-kaḷ* and *pū* + -*kkaḷ* respectively. Thus morphemess are released as the phonological representations of morphemes. In the words *kaṇkaḷ* and *pūkkaḷ* one and the same grammatical meaning, that is the morpheme of plural number, is, phonologically represented by two different morphs: the phoneme sequence -*kaḷ* and the phoneme sequence *-kkaḷ* which is an allomorph. In Tamil morphology morphs are concatenated in a sequence as suffixes after a stem.

3. 2. 1 FREQUENCIES OF MORPHOLOGICAL ELEMENTS

Frequency is one of the innumerable properties of a word. It is no intrinsic property because it cannot be measured directly on the word using some operational definitions. It can be determined by counting number of occurrences of a word in a finite number of specimens of text. Its relative value changes from text to text and its population value cannot be stated at all because there are no true populations in language (cf. Orlov, Boroda et al. 1982). Frequency as a measure of Morphological elements occurring in a corpus of texts is one of the most favorite issues in quantifying approaches to the language. Discrete Morphological elements, are a necessary precondition

for any theoretical study. The studies to lexical frequencies and their behavior became established as a discipline on its own right.

3. 3 WORD CLASSES IN MODERN TAMIL

The modern Tamil grammarians such as Asher (1982), Kothandaraman (1986) and Lehmann (1989) have posited new word classes for Modern Tamil. Lehmann has elaborately discusses the word classes in Tamil. Words of a language are generally assigned to parts of speech/word classes according to their grammatical properties. These grammatical properties comprise both morphological and syntactic properties. Thus, words are assigned to parts of speech/word classes according to the grammatical categories, their distribution in the sentence, their syntactic function, etc. There is no agreement in the grammatical literature as to how many parts of speech/word classes should be distinguished in Modern Tamil. Bloomfield, L. (1993) as stated in Kothandaraman (1997:24) that "it is impossible to set up a fully consistent scheme of parts of speech, because the word-classes overlap and cross each other" (*Language* p. 196). Applying both morphological and syntactic criteria in examining the grammatical properties of words in Modern Tamil, it is proposed that there are eight parts of speech/word classes for Modern Tamil viz. nouns, verbs, postpositions, adjectives, adverbs, quantifiers, determiners, and conjunctions cf. Kothandarama (1997). According to Lehmann, in modern Tamil all lexical or root morphemes can be classified into four types: two major groups of nominal and verbal roots and two minor groups of adjectival roots and adverbial roots. As Rajendran (2005) pointed out in his paper that 'based on the shape all the words can be considered as being inflected or uninflected forms of the roots of noun, verb, adjective and adverbs. Nouns contain noun roots and verbs contain verb roots. But postpositions, many adverbs, quantifiers and conjunctions can be considered as inflected and uninflected forms of nominal or verbal roots'. As number of word classes proposed for Old Tamil are very few in number, a

number of inflected and uninflected forms are reanalyzed in Modern Tamil to closed classes of various parts of speech/word classes as postpositions, adjectives, adverbs, quantifiers, etc. As we know only two word classes, nouns and verbs inflect. Noun inflects for case and number and verbs inflect for tense, aspectual and modal category besides person, gender and number. Kothandraman (1989) classifies the free words into ten categories such as noun, verb, adjective, adverb, intensifier, conjunctions, interjection, introductory, summoners and responsive. Asher (1982:101-102) under the heading 'Operational definitions for word classes' classifies words into six classes such as nouns, pronouns, verbs, adjectives, postpositions, numerals or quantifiers, particles, exclamation, words expressing feeling, addressing words, and words accepting address. He considers certain bound forms such as suffixes as dependent class and classifies them based on their shape and characterizes into five types like suffix, postposition, verbal participle, clitics, and fillers. All the three scholars have taken verb, noun, and adjective as word classes. Kothandaraman and Lehman have taken adverb and conjunction as word classes. Asher and Lehman have taken postposition as a word class. But Kothandaraman has taken postposition as a dependent class. *kriyāvin̲ tar̲kkālat tamiz akarāti*: *tamiz-tamiz-āṅkilam* (2008) identifies the following word classes to categorize the words listed in the dictionary: *iṭaiccol* 'particles', *iṇaippu iṭaiccol* 'conjunctive particle', *etirmar̲ait vin̲aimur̲r̲u* 'negative finite verb', *cuṭṭuppeyar* 'pronoun', *cuṭṭuppeyaraṭai* 'demonstrative adjective', *tuṇaivin̲ai,* 'auxiliary verb', *peyarccol* 'noun', *peyaraṭai* 'adjective', *vin̲aiccol* 'verb, *vin̲aiyaṭai* 'adverb', *vin̲aimur̲r̲u* 'finite verb', *viḷippu iṭaiccol* 'address particle'. Here we examine some of the major and minor word classes as proposed by ILILMT group for Tamil include the following. They are essentially defined on the basis of morphological inflection and syntactic context.

(i) Nouns (ammā ‘mother’)

(ii) Verbs (vā ‘come’)

(iii) Adjectives (nalla ’good’)

(iv) Adverbs (manner: avvāṟu 'likewise')

(v) Nouns of Space and Time (mēl 'up', arukil 'near')

(vi) Number words (pattiliruntu 'from ten')

(vii) Pronoun (avarkaḷ 'they (human)')

(viii) Quantifiers (koñcam 'little')

(ix) Quotative (eṉṟu 'that')

(x) Conjunctions (āṉāl 'but')

(xi) Interjections (ayyō 'hurrah')

(xii) Postpositions (paṟṟi 'about')

(xiii) Demonstratives (anta 'that')

3. 4 NOUNS

In Tamil, nouns are capable of taking number, gender and case based on their morphological characteristics. For example:

140259 *āciriyarkaḷukku* ('to teachers')

34804 *ālōcaṉaikkāka* ('for advice')

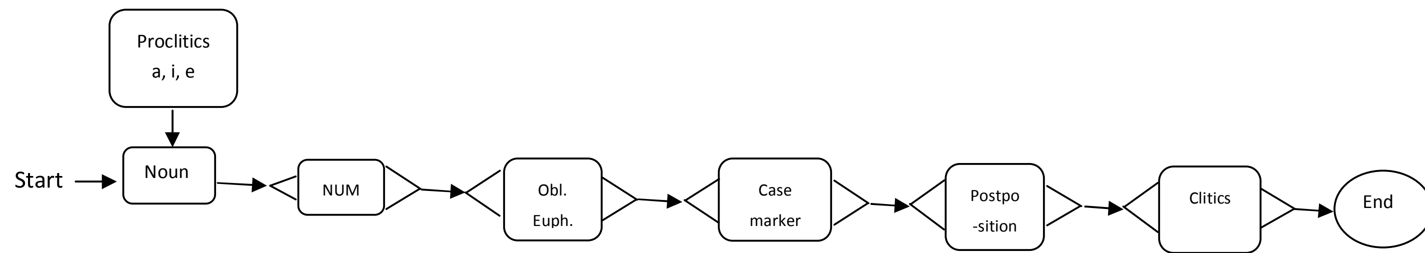

33407 *aḷavukaḷai* ('of measurements)

28330 *amaiccarukku* ('to ministers)

26481 *amaippiliruntu* ('from organization')

See the following noun flow chart, which is capable of taking number of possible suffixes.

FREQUENCY OF TAMIL MORPHOLOGICAL ELEMENTS

NOUN FLOW CHART

3. 4. 1 GRAMMATICAL MORPHEMES

A morpheme is the smallest unit of language that conveys a meaning or that has a role in grammatical structure (Cook, 1993). It can be an affix or it can exist as a free standing
word. An inflectional grammatical morpheme attached to the word for purely grammatical reasons, rather than lexical reasons, such as a verb takes tense, aspectual modal, person, number and gender (PNGs) and noun, inflects for number and case markers in order to show their relationship in terms of their grammatical behavior. Though thousands of combinations of inflectional morphemes (including few allomorphs) exist in the nominal and verbal inflection of Tamil, only few hundreds exist in the corpus. The following are some of the suffixes: plural (*-kaḷ* and *-kkaḷ*), accusative case (*-ai*), dative case (*-kku*, *-ukku*, *-akku*), benefactive (*-ukkāka*, *-kkāka*, *-akkāka*), instrumental (*-āl*), sociative (*-ōṭu*, *–uṭaṉ*), locative (inanimate) (*-il*), locative (animate) (*-iṭam*), ablative (*-illiruntu*), genitive (*-iṉ*, *-atu*), past tense (*-t*, *-nt*, *-iṉ*, *-ṉ*, *-tt*, *-ṭ*, *-ṭṭ*, *-ṟ*), present tense (*-kiṟ*, *-kkiṟ*, *-kiṉṟ*, *-kkiṉṟ*), future tense (*-p*, *-v*, *-pp),* future habitual (*-um*, *-kkum*, *-kum*), negative (*–ā*, *-kkā*, *-kā*) first person singular (*-ēṉ*,), first person plural inclusive (*-ōm*), second person singular (*-āy*), second person singular honorific (*-īr*, *-īrkaḷ*) second person plural (*-īrkaḷ*), third person singular masculine (*-aṉ*, *āṉ*), third person singular feminine (*-āḷ*), third person singular honorific (*-ār*), third person plural (*-ārkaḷ*) third person singular non human (*-atu*), third person plural non human (*-aṉa*), infinitive marker with variations (*–a*, *-ka*, *-la*, *-ya*, *-kka*, *-ḷa* and *-ṇa*), relative participle (*-um*), prefix (*-a*, *-i*, and *-e*), honorific marker (*-avarkaḷ*), restrictive clitic (*-maṭṭum*), emphatic clitic (*-tāṉ*), interrogative clitic (*-ā*), emphatic clitic (*–ē*), disjunctive clitic (*-ō*), inclusive clitic (*-kūṭa*), cardinal (*-āvatu*), suppositive (*-ām*), vocative clitic (*-aṭa* 3p singular masculine), vocative clitic (*-aṭē* 3p singular masculine), vocative clitic (*-aṭī* 3p singular feminine), vocative clitic (*-ayyā* 3p singular honorific masculine), vocative clitic (*-ammā* 3p singular honorific feminine), vocative

clitic (-*appā* 3p singular honorific masculine), ordinality suffix (-*mutal, -ām, āvatu*), verbal participle (-*ttu*), conditional marker (*–āl, iṉ, -yēl*), negative form (-*ṉiṉṟi, -ṉiṉṟu*), negative verbal participial marker (-*āmal*), negative conditional form (-*āviṭṭāl*), negative past form (illai), co-ordinating particle (-*um*), subordinating particle (-*eṉpatu*), quotative particle (-*eṉṟu, -eṉa*), confirmative particle (-*allavā*), agreement and disagreement particle (-*āmām*), nominalizer form (-*atu*), derivational adjective (-*āṉa*), derivational adverb (-*āka, -āy, -muṟa*), euphonic suffix increment (-*iṉ*-), oblique suffix increment (-*tt, -aṟṟu*), feminine gender marker (-*i*) and so on.

3. 4. 2 MOST FREQUENTLY OCCURRING 100 WORDS AND THEIR CATEGORY IN THE CORPUS

Frequency statistics concerning with morphology are essentially frequency counts of random variables where variables are words or morphological elements and their frequencies vary from text to text or from time to time with a real text. Morphological statistics are discrete since they are always in terms of integer value unlike that of phonetics where non-integer values are expected. Tamil lexical database (CALTS CIIL Corpus) lists words in the order of higher frequency to lower frequency as in the flowing. Only the first 20-150 words are shown here due to space constrain.

The top hundred words present an interesting observation. A majority of these top frequency words are functional words or a mix of both function + lexical words due to homophony. For example vēṇṭum can be main verb or an auxiliary similarly koṇṭu postposition and of main verb or an auxiliary. The first lexical word is makkaḷ with the rank of 35, a list of such words and their category is shown in Table 2. It shows that the first few words have a higher coverage considerably, the coverage goes down drastically as the frequencies of words fall drastically. The first 100 words cover only 13.43% of the entire corpus a very significant observation if you compare with other languages

like Telugu, Hindi etc. see frequency study of Brown corpus, BNC and TDIL - CIIL corpus of Indian languages at CALTS (PGDCAIL-421 course material).

Table-1

The table-1 bearing the top 100 words with their categories display the word *oru* in its first place, which functions as a quantifier or an adjective. The second place is occupied by the adverb *eṉṉu*, which functions as quotative and noun (means 'which day') and third place by *vēṇṭum*, which is a defective verb. The fourth place is occupied by demonstrative *inta*. The fifth place is by quotative *eṉṉa* and the sixth place is by *allatu*, which is a particle. The seventh

one is by *koṇṭu*, which can function as verbal particle or postposition. The eighth place by *pala*, which is a quantifier. The ninth place was occupied by *itu*, which is a pronoun. The tenth one is by a particle *āṉāl*. Likewise if we observe the most frequent 100 words in the corpus, 15 words are nouns, 19 words are verbs, 5 words are adverbs, 7 words are postpositions, 20 words are pronouns, 6 words are verbal participles, 6 words are adjectives, 3 words are demonstrative, 9 words are quantifiers, 2 are quotative, 9 are particles and one relative participle.

Number of occurrence	Category	% Coverage to the extracted total frequencies
20	pronouns	19.60
19	Verb	18.62
15	Noun	14.70
9	quantifiers	8.82
9	particles	8.82
7	postpositions	6.86
6	verbal participle	5.88
6	adjectives	5.88
5	adverbs	4.90
3	demonstratives	2.94
2	quotatives	1.96
1	relative participle	0.98

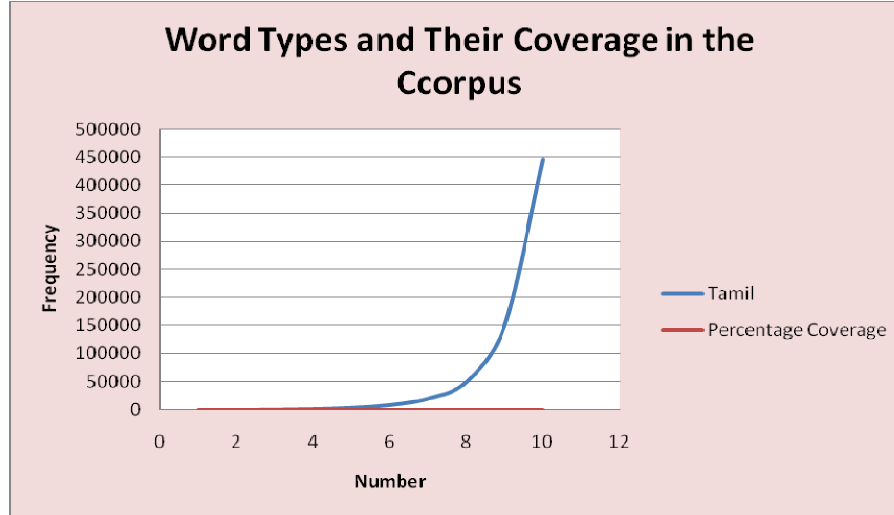

Table-2

3. 4. 2. 1 Word Types and Their Coverage in the Ccorpus

Sl. No.	Tamil	Percentage Coverage
1	59	10%
2	257	20%
3	728	30%
4	1803	40%
5	4091	50%
6	8992	60%
7	20191	70%

8	49772	80%
9	149507	90%
10	445205	100%

Table-3

Line Chart-1

Considering the corpus is considerable in size, and representative of the language table-4 reveals that the number of words required to cover a particular percentage in the corpus. Tamil takes 59 words to reach 10% and 257 words to reach 20%, 272 words to reach 30%, 1803 words to reach 40%, 4091 words to reach 50%, 8992 words to reach 60%, 20191 words to reach 70%, 49772 words to reach 80% and so on. The table shows that little less than 50k words cover 80% of the language. As one go down the table are may observe that to reach a particular percentage it needs more and more distinct words in the language. We see that the number of words increase more rapidly to reach higher percentages in the language.

This sort of quantitative information must be relatable to the complexity of inflectional morphology of the language. Since, Tamil is morphologically rich, it confirms the facts of the existing knowledge about this language. Thus, the fact that the language has more word types hence less

word frequency is proved. What we find in the above table is that the lesser frequency word types are more in the language.

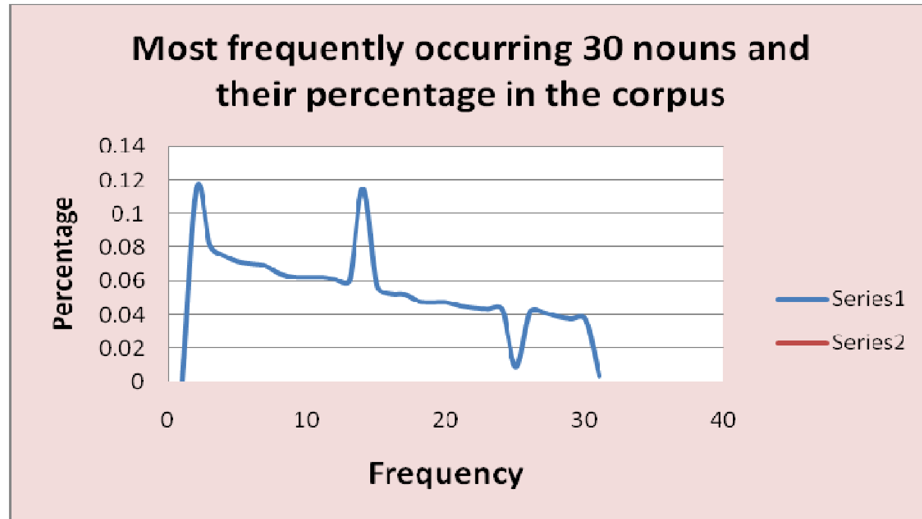

3. 4. 2. 2 MOST FREQUENTLY OCCURRING 30 NOUNS AND THEIR PERCENTAGE IN THE CORPUS

The table-4 displays the 30 most frequent nouns and their frequencies along with percentage. The total 30 words (noun) have a coverage of 1.65% only which is an indication that in Tamil nouns are more or less always occur with inflected forms and distributed across the corpus. If you need to show a considerable coverage one need to go down the list as much as few thousands of them.

sl. no.	Frequency	words	% Coverage in total corpus
1	3446	makkaḷ	0.1148
2	2431	muṟai	0.0810
3	2248	peyar	0.0749
4	2147	kālattil	0.0715
5	2108	aḷavu	0.0702
6	2072	iṭam	0.0690
7	1930	poruḷ	0.0643
8	1868	uṭal	0.0622
9	1864	nāḷ	0.0621
10	1863	mozi	0.0621
11	1834	vēlai	0.0611
12	1802	aracu	0.0600
13	1712	āṇṭu	0.1148
14	1704	araciyal	0.0568
15	1569	kāraṇam	0.0523
16	1558	ellām	0.0519
17	1441	vakaiyil	0.0480
18	1424	kālam	0.0474
19	1422	peṇ	0.0474
20	1357	aḷavil	0.0452
21	1320	tozil	0.044
22	1307	caṭṭam	0.0435
23	1292	vazi	0.0430
24	1275	ṭākṭar	0.0091
25	1248	pozutu	0.0416
26	1240	nāṭṭil	0.0413
27	1169	paṭam	0.0389
28	1129	maṉam	0.0376

29	1120	pakuti	0.0373
30	1095	camayam	0.0036

Table -4

Line Chart-2

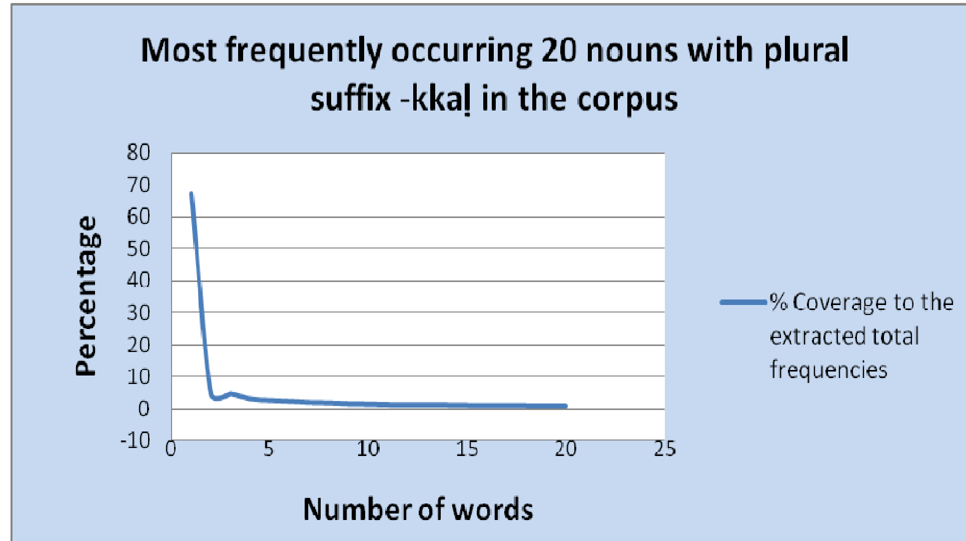

The Line chart-2 is representing table-4, which describes the most frequently occurring 30 nouns in the corpus. What we observe from chart-1 is that the first word has occupied 0.1148% compared to the rest words, which is less than 1 percent of the total percentage. If we take first 10 words out of first 30 words, one is related to *makkaḷ* 'people' with 3446 tokens occurrence in the corpus.

3. 4. 2. 3 MOST FREQUENTLY OCCURRING 20 NOUN WITH PLURAL SUFFIX –*kaḷ* AND THEIR PERCENTAGE

Tamil nouns are often marked for plurality. Most frequently occurring 20 nouns with plural suffix as –*kaḷ* and their cumulative percentage in the corpus are listed. The allomorph –*kkaḷ* has occurred 3446 tokens in the corpus. One can see table-4 below that the allomorph –*kaḷ* is more frequent than the alternative allomorph –*kkaḷ*. It is because nouns that take the allomorph –*kaḷ* is more frequent than the nouns that take the allomorph –*kkaḷ* in Tamil.

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	785	peṇkaḷ	8.57
2	767	poruḷkaḷ	8.37
3	713	nūlkaḷ	7.78
4	556	muṟaikaḷ	6.07
5	504	āṇṭukaḷ	5.50
6	491	kuzantaikaḷ	5.36
7	490	nāṭkaḷ	5.35
8	456	coṟkaḷ	4.98
9	422	ceytikaḷ	4.61
10	412	kaṇkaḷ	4.50
11	409	māṇavarkaḷ	4.46

19	321	paṭaṅkaḷ	3.50
20	307	poruṭkaḷ	3.35

Table-5

XY Scatter Chart-3

There are several ways to classify the types of nouns that exist in any language. If we take the first top 20 nouns with *–kaḷ* as suffixes in Tamil, the three *peṇkaḷ, kuzantaikaḷ,* and *māṇavarkaḷ* are human concrete nouns and seven are non-human concrete nouns such as *poruḷkaḷ, nūlkaḷ, kaṇkaḷ, pakutikaḷ, karuvikaḷ, paṭaṅkaḷ, poruṭkaḷ* and ten are abstract nouns such as *muṟaikaḷ, āṇṭukaḷ, nāṭkaḷ, coṟkaḷ, ceytikaḷ, vakaikaḷ, nāṭukaḷ, pāṭalkaḷ, kataikaḷ, mozikaḷ*. In words like *nāṭkaḷ, coṟkaḷ, paṭaṅkaḷ* and *poruṭkaḷ* one can observe the morphophonemic changes such as *-ṭ, -ṟ,* and ṅ. The above Scatter Chart -3 also represents the same in table-5. In the above table, the plural marker *-kaḷ* occurred mostly with bisyllabic word then followed by trisyllabic and monosyllabic words.

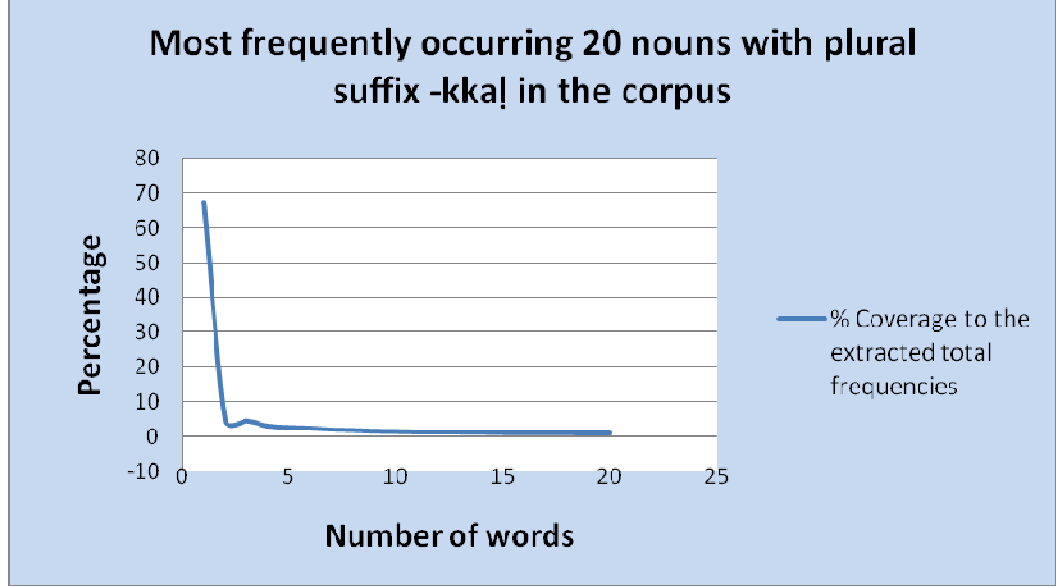

3. 4. 2. 5 NOUN WITH PLURAL SUFFIX *–kkaḷ* AND THEIR PERCENTAGE

Table-6 contains most frequently occurring twenty nouns with allomorph *–kkaḷ* as plural suffix.

S.No.	Frequency	Word	% Coverage to the extracted total frequencies
1	3446	makkaḷ	67.38
2	228	potumakkaḷ	4.45
3	227	karuttukkaḷ	4.43
4	148	pūkkaḷ	2.89
5	125	aṇukkaḷ	2.44
6	112	ezuttukkaḷ	2.19
7	95	puzukkaḷ	1.85
8	86	kuzukkaḷ	1.68
9	73	perumakkaḷ	1.42
10	69	kuṭimakkaḷ	1.34
11	60	vizākkaḷ	1.17
12	59	kēmarākkaḷ	1.15
13	58	uṟuppukkaḷ	1.13
14	55	vāyukkaḷ	1.07
15	50	rōpōkkaḷ	0.97
16	48	maṉukkaḷ	0.93
17	46	uyiraṇukkaḷ	0.89
18	46	intukkaḷ	0.89

19	43	amaippukkaḷ	0.84
20	40	pirapukkaḷ	0.78

Table-6

XY Scatter Chart - 4

The rest of the words like *karuttu, aṇu, pū, puzu, kuzu, uṟuppu, vāyu, maṉu, uyiraṇu, intu, amaippu and pirapu* are uniqe in their own way because they all ends in *u* and *ū* as root words. And also words such as *vizā, kēmarā* and *rōpō* end in long vowel such as -*ā* and -*ō*.

3. 4. 2. 6 DISTRIBUTION OF NOUNS AND THEIR INFLECTIONAL ENDINGS

Most frequently occurring 150 inflected nouns with their cumulative percentage from the corpus are listed below:

S.No.	Frequency	Words	% Coverage to the extracted total frequencies
1	2267	nilaiyil	3.50375568

Table-7

What we can understand from the above table-6 is that among the top 150 nouns with inflectional endings, the locative suffix *–il* is the most frequent one in Tamil. It has occurred 37,304 tokens when compared to the other inflectional endings. Next to locative suffix *–il*, the plural suffix *–kaḷ* has occupied the second place and its total occurrences is 19,602 among 150 nouns from the corpus. The genitive marker *-iṉ* has occurred 5800 tokens and *–ukku* as allomorph of dative case 1757 tokens and the accusative case marker *–ai* as 3857 tokens and 465 tokens *–kku* as allomorph of dative case. The rest of the case such as *-iliruntu*, *-uṭaṉ*, *-ōṭu* and *-āl*, are not occurred even single time among the first 150 words of the corpus. It seems that these cases markers are less frequent when compared to others. One can see their probability and percentage against their occurrences of inflectional endings. Another interesting thing to observe is the sandhi *–y* has occurred 1,84,061 tokens with the combination of locative case suffix *–il* among top 305 noun inflectional endings.

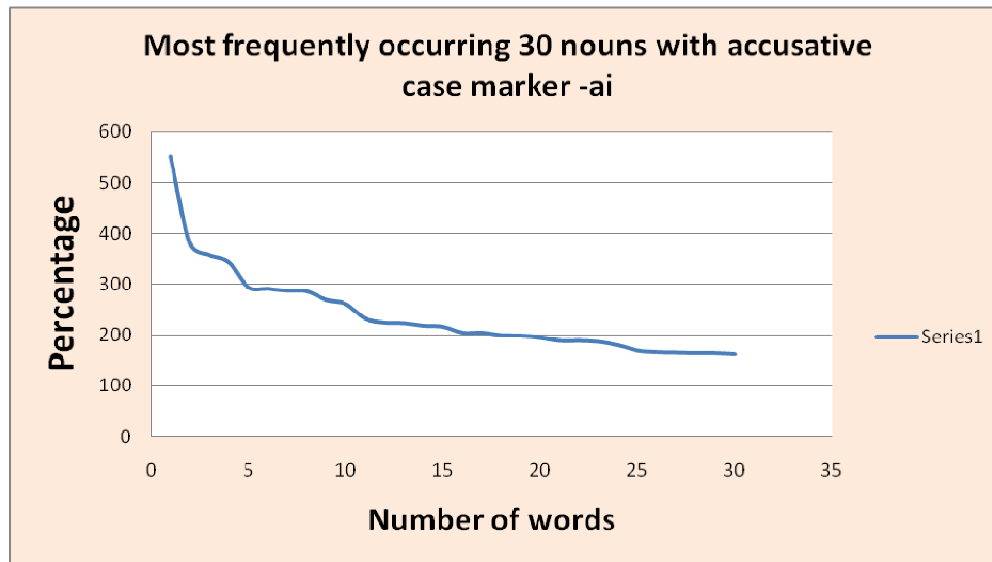

3. 4. 2. 7 FREQUENTLY OCCURRING 30 NOUNS WITH ACCUSATIVE CASE MARKER -*ai*

In Tamil, a suffix that is responsible for the change of relationships of the noun to a verb in the sentence and that is called as a case marker and such relationships are called cases (Kothandaraman, P 1997). The accusative case marker -*ai* occurs 7168 tokens and scores and first place among 30 words which carries –*ai* as case marker. Nouns with the accusative case marker -*ai* as the object or patient of some actions; it is the thing to which the action of the verb is applied or subjected to (Schiffman 1999). Most frequently occurring 30 nouns with accusative case marker –*ai* and their probability along with percentage are as follow:

Sl.No.	Frequency	Words	% Coverage to the extracted total frequencies
1	552	nilaiyai	7.700892857
2	380	poruḷkaḷai	5.301339286

30	162	talaiyai	2.260044643

Table-8

XY Scatter Chart -5

What we observe from table-8 is that most frequently occurring top five words with case marker *-ai* two are abstract nouns and two are concrete nouns. Likewise, if we take the entire 30 words, six are related to human and body parts, nine are concrete nouns, and fifteens are abstract nouns.

3. 4. 2. 8 MOST FREQUENTLY OCCURRING 30 NOUNS WITH -*kku* AS DATIVE CASE MARKER

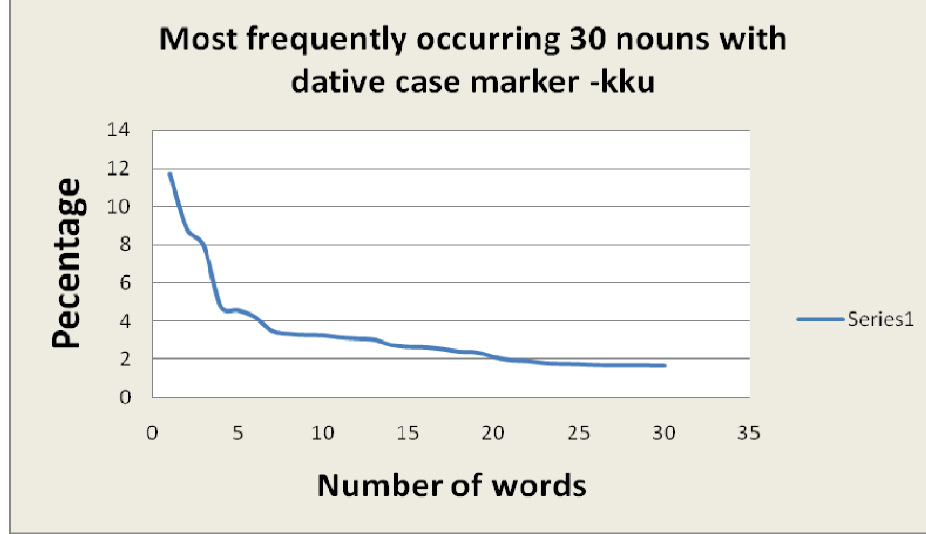

The dative case marker –*kku* has –*akku* as its alternant from table-8. What we observer from the list is that the noun –*aḷavu* with –*kku* is most frequent one, the allomorph –*ukku* is more frequent when compared to another allomorph –*kku*. Most frequently occurring 30 nouns with dative –*kku,* –*ukku* and –*ku* and their percentage are listed below.

Sl.No.	Frequency	Words	% Coverage to the extracted total frequencies
1	619	aḷavukku	11.6991117
2	468	makkaḷukku	8.845208845

29	90	nāṭṭukku	1.701001701
30	89	niṉaivukku	1.682101682

Table-9

What we observe from table-9 is that there are 15 nouns inflected with *–ukku* 8 with *–kku* and 4 *–ku*. Among the nouns, *aḷavu* with *–ukku* has occurred 619 tokens and *nilai* with *–kku* 242 tokens.

XY Scatter Chart-6

3. 4. 2. 9 MOST FREQUENTLY OCCURRING 30 NOUNS WITH SOCIATIVE CASE MARKER -*ōṭu*

The sociative case marker -*ōṭu* has its alternant -*uṭaṉ,* which has an alternate occurs with written variant. This sociative case marker *–ōṭu* gives the sense of *with* or *along with* in English. Most frequently occurring nouns with sociative case marker -*ōṭu* and their cumulative percentage are listed here from the corpus:

Sl.No.	Frequency	Words	% Coverage to the extracted total frequencies

29	16	eṇṇattōṭu	1.937046005
30	16	āṇkaḷōṭu	1.937046005

Table-10

One can observe from table-10 that among the first 5 words *aṉpōṭu* ‘with love’, *uyirōṭu* ‘with life’, *makizcciyōṭu* ‘with happiness’, *uṇarvōṭu* ‘with feeling’, *ārvattōṭu* ‘with interest’ and with *-ōṭu* as sociative case marker are abstract nouns. Likewise if we take first 15 words, 13 are abstract and one is concrete *makkaḷōṭu* ‘with people’ and another one is a body part *uṭalōṭu* ‘with body’ with different frequencies. When we observe in the second half of the table 2 nouns *kaṇavaṉōṭu* ‘with husband’, *āṇkaḷōṭu* ‘with males’, and one is feminine *maṉaiviyōṭu* ‘with wife’. There are two body parts *kaiyōṭu* ‘with hand’, *mukattōṭu* ’with face’ and the one is gerundial form *peṟuvatōṭu* ‘with act of getting’ and the rest of them are abstract nouns.

3. 4. 2. 10 MOST FREQUENTLY OCCURRING 30 NOUNS WITH SOCIATIVE CASE MARKER –*uṭan̲*

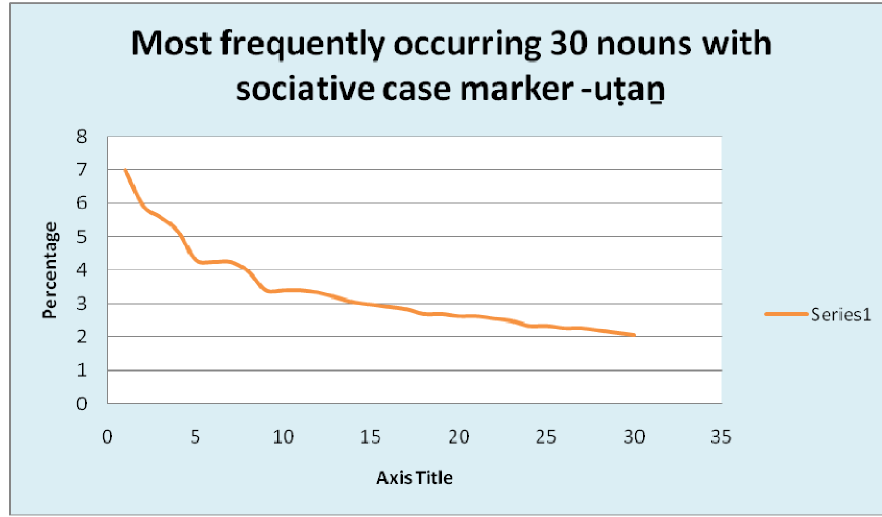

The alternant -uṭan̲ is said to be more frequent with the written style and was considered to be older form and has historically given rise to modern colloquial -ōṭu. Table-11 depicts that -uṭan̲is more frequent in the corpus and the inflected forms of nouns are same more or less with -ōṭu and -uṭan̲. These do not seem to be any significant difference between the two.

Sl.No.	Frequency	Words	% Coverage to the extracted total frequencies
1	99	an̲puṭan̲	6.996466431

29	30	celvākkuṭaṉ	2.120141343
30	29	eccarikkaiyuṭaṉ	2.049469965

Table–11

In the above table-11, one can observe that nine are human and inanimate nouns, the rest are abstract nouns. The abstract noun *aṉpu* 'love' has occurred 99 tokens which is most frequent one and *eccarikkai* 'warning' is less frequent with 29 tokens among the nouns with *–uṭaṉ* as sociative case marker from the corpus.

XY Scatter Chart-7

3. 4. 2. 11 MOST FREQUENTLY OCCURRING 30 NOUNS WITH INSTRUMENTAL CASE MARKER *-āl*

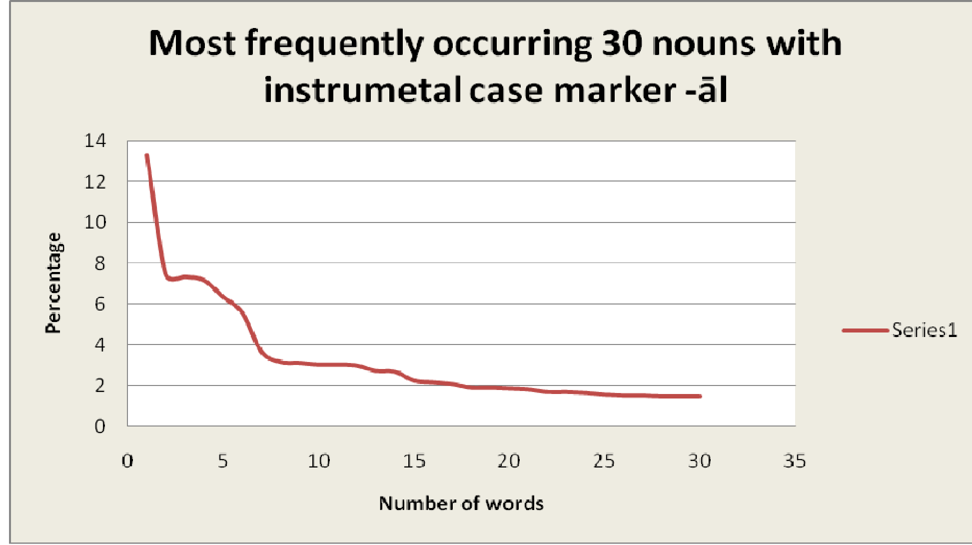

The instrumental case marker is *–āl* in Tamil. Most frequently occurring 30 nouns with *–āl* as instrumental case marker and their percentage have been listed below:

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	310	kāraṇattāl	13.28191945
2	173	utaviyāl	7.412167952

29	35	viralāl	1.499571551
30	35	vāyāl	1.499571551

Table-12

What one can observe from table-12 is that out of 30 words with *–āl* instrumental as case marker, in first five words, four are abstract and one is concrete noun. If we take the next five words two are objective nouns and three are abstract nouns. If we see over all 30 words, 18 words are concrete nouns and the rest of them are abstract nouns.

XY Scatter Chart- 8

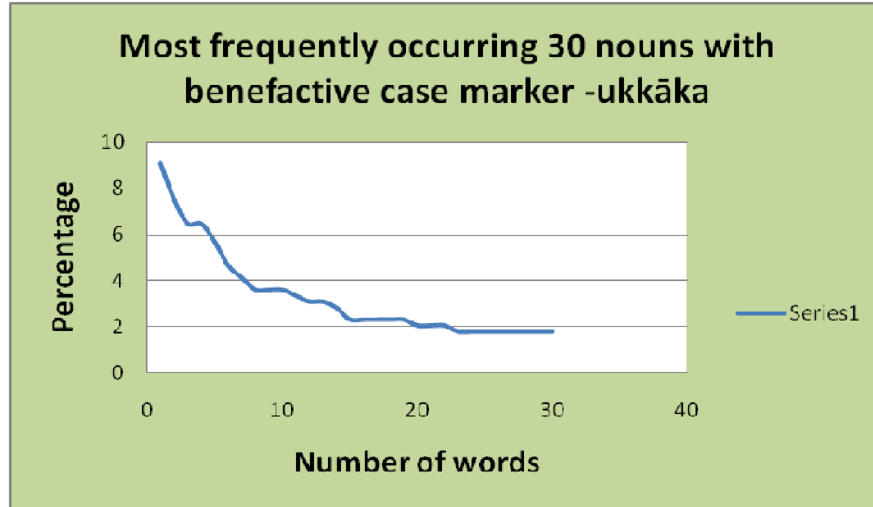

3. 4. 2. 12 MOST FREQUENTLY OCCURRING 25 NOUN WITH BENEFACTIVE CASE MARKER *-ukkāka*

Rajaram (1976), Nadaraja Pillai (1982) and Lehmann (1989:35) identify that 'the benefactive case marker is formed by the affixation of the bound postposition *–āka* to the dative case suffix *–ukku* (for examble, *uṇakkāka*). The bound postposition *–āka* is actually the infinitive form of the verb *āku* 'become', which has been grammaticalized to a bound postposition. Most frequently occurring nouns with benefactive case and their percentage are listed in the below:

Sl.No.	Frequency	Words	% Coverage to the extracted total frequencies
1	35	kāraṇaṅkaḷukkāka	9.090909091
2	29	makkaḷukkāka	7.532467532

27	7	paricōtaṉaikkāka	1.818181818
28	7	vicāraṇaikkāka	1.818181818
29	7	koḷkaikkāka	1.818181818
30	7	amaitikkāka	1.818181818

Table-13

XY Scatter Chart-9

Table-13 bears most frequently occurring 30 words with *-ukkāka* as benefactive case marker 6 words are concrete noun with *-ukkāka* 24 are abstract nouns with *-ukkāka*. The nine words such as *kāraṇaṅkaḷukkāka*, *makkaḷukkāka*,

paṇikaḷukkāka, kuzantaikaḷukkāka, tēvaikaḷukkāka, kāraṇaṅkaḷukkākavum, nōkkaṅkaḷukkāka, kāriyaṅkaḷukkāka, and *makkaḷukkākavum* have *-kaḷ* as plural marker preceding by *-ukkāka*. Out of these nine words three are human nouns.

3. 4. 2. 13 MOST FREQUENTLY OCCURRING 30 NOUNS WITH ABLATIVE CASE MARKER *-iliruntu*

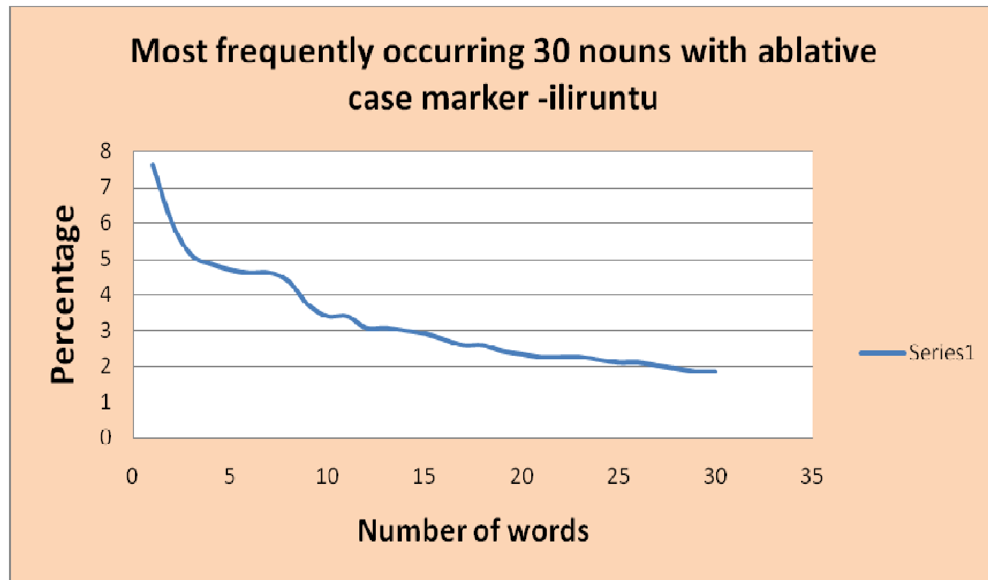

The ablative case is marked by the suffix *-iliruntu* in Tamil which may be added to the noun. For example, see table-13 which bears most frequently occurring 30 words with *-iliruntu* as ablative case marker and their percentage have been listed below:

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	94	nilaiyiliruntu	7.617504052
2	74	iṭattiliruntu	5.996758509
3	63	nāṭṭiliruntu	5.105348460
4	60	mēliruntu	4.862236629
5	58	nāḷiliruntu	4.700162075
6	57	pakutiyiliruntu	4.619124797
7	57	tētiyiliruntu	4.619124797
8	54	kālattiliruntu	4.376012966
9	46	moziyiliruntu	3.727714749
10	42	pūmiyiliruntu	3.403565640
11	42	vīṭṭiliruntu	3.403565640
12	38	poruḷkaḷiliruntu	3.079416532
13	38	kaṭaliliruntu	3.079416532
14	37	uṭaliliruntu	2.998379254
15	36	āṇṭiliruntu	2.917341977
16	34	nīriliruntu	2.755267423
17	32	ōriṭattiliruntu	2.593192869
18	32	vāyiliruntu	2.593192869
19	30	pakkattiliruntu	2.431118314
20	29	ciṟaiyiliruntu	2.350081037
21	28	tūrattiliruntu	2.269043760
22	28	nāṭukaḷiliruntu	2.269043760
23	28	muṉaiyiliruntu	2.269043760
24	27	poruḷiliruntu	2.188006483
25	26	vēlaiyiliruntu	2.106969206
26	26	taraiyiliruntu	2.106969206

27	25	cūriyaṉilituntu	2.025931929
28	24	iṭaṅkaḷiliruntu	1.944894652
29	23	nilaiyattiliruntu	1.863857374
30	23	nilattiliruntu	1.863857374

Table-14

Interestingly, except for the *mozi* 'language', *poruḷ* 'thing', *uṭal* 'body', *vāy* 'mouth' - all other nouns are nouns of places and tokens. It is possible that other noun of abstract nature that can be inflected for *-iliruntu* 'from' but their frequency is too low to be depicted here.

XY Scatter Chart–10

8	231	iṭam	0.361802
9	94	iliruntu	0.147227

Table-16

Scatter with Smooth Line Chart-1

Among the noun inflections, the locative case marker –*il* has occupied the first place and followed by the plural marker –*kaḷ* and the third the genitive case marker -*iṉ* and the fourth the accusative case marker -*ai* and fifth the dative case marker –*ukku* and the six the instrumental case marker -*āl*. The seventh place is by sociative case marker -*uṭaṉ* and the eighth place is by locative case

marker *-iṭam* that is an alternant of *–il* and followed by ablative case marker *–iliruntu.*

3. 4. 2. 15 MOST FREQUENTLY OCCURRING 100 BIGRAM SEQUENCES OF NOUNS IN THE CORPUS

According to Laurie Bauer (1988), constructions of noun + noun have been treated in two distinct ways in the literature: either they have been treated as compounds, or they have been treated as noun phrases with modifiers, which happen to be nouns. Sometokens it is assumed that there are two distinct classes, which can be neatly distinguished. It is known that compounding as a concatenation of words is commonly used to pack meaning into a minimal amount of linguistic structure. A widely accepted view of noun strings (NNs) is that they can be either compound nouns or NPs in which the first noun (N1) is the syntactic premodifier of the second (N2).

Table-14

The bigram of nominal sequences display very frequently occurring nouns in sequences. Most of these are easy to identify otherwise they include such as morphological terms proper noun, common terms, technical terms etc. For example, tamiz nāṭṭil 'in Tamil Nadu', mānila aracu 'State Government', intiya aracu 'Indian Government', tamiz mozi 'Tamil Language', tamizp palkalaikkazakam 'Tamil University', araciyal caṭṭam 'constitution', mattiya aracu 'Central Government', āṇ peṇ 'male and female', kai kāl 'hand and leg' etc. The high frequency bigram are mostly of common usage term in sociopolitical life where the less frequent bigram are from specialized categories and domains for example camutāya moziyiyal, paṇṭaik kālattil etc.

3. 4. 2. 16 FREQUENTLY OCCURRING 20 DERIVATIONAL NOUNS AND THEIR COVERAGE IN THE CORPUS

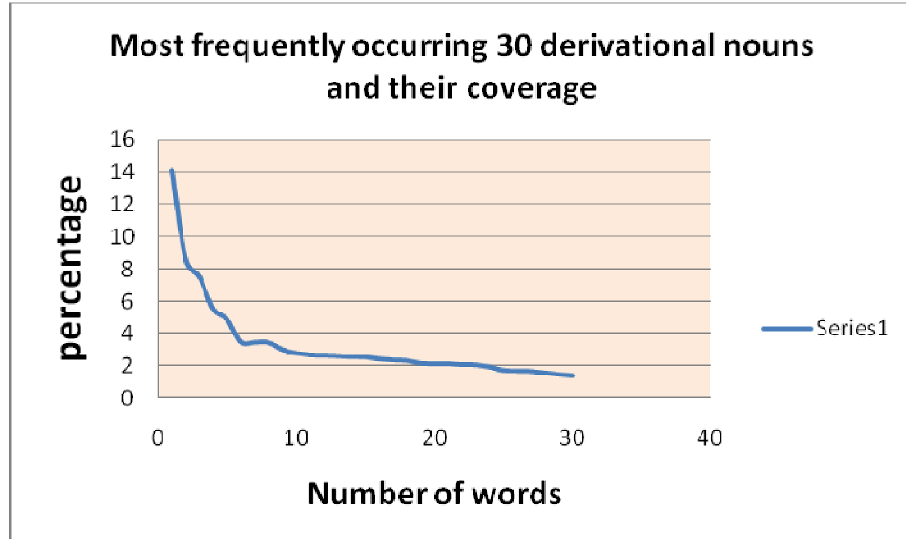

The table below lists most frequently occurring 20 derivational nouns and their percentage coverage in the corpus.

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	2028	iruntatu	14.04432133
2	1242	vantatu	8.601108033
3	1082	amaippu	7.493074792
4	799	vaḷarcci	5.533240997

26	251	makizcci	1.738227147
27	248	vakuppu	1.717451524
28	233	kuṟippukaḷ	1.613573407
29	220	amaintatu	1.523545706
30	208	kaṟuppu	1.440443213

Table–16

Table-16 depicts thirty most frequently occurring derivation nouns involving the –ppu, -atu, -(c)ci, and –am. These are certainly derivational suffixes in Tamil. However, derivational nouns, which frequently occur in the corpus have only these suffixes. The derivational suffix –ppu is more frequent closely followed by –atu and –(c)ci and –am being the far less frequent one.

XY Scatter Chart-11

The above XY Scatter Chart-1 represents data in table-16, which contains most frequently occurring 30 derivational nouns from the corpus. It shows that

derivational suffixes do not occur even at 10% of the corpus. This shows that derivational suffixes are not frequent as inflectional suffixes in the corpus.

3. 4. 2. 17 NOUNS WITH SANDHI AND THEIR PERCENTAGE

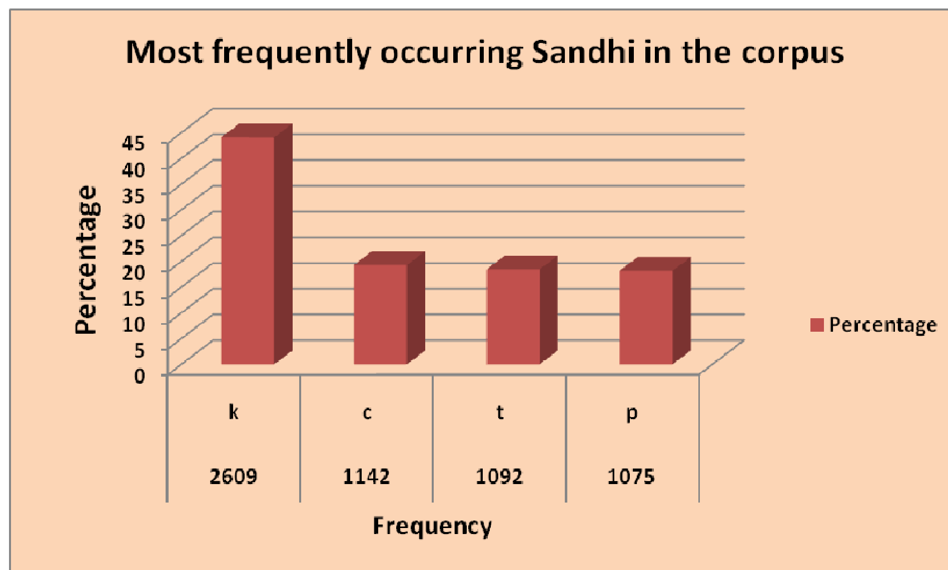

In Sanskrit, the term *Sandhi* is known in the sense of 'joining'. Pānini, the famous Sanskrit grammarian, uses the term saṁhitā to denote sandhi or contact of forms or phonetic units of forms or words in sentences (Subrahmanya Sastri, 1947:74). According to Hall (1969:138-139) the phonetic assimilations are best described as concomitant effect of juncture, and all such effects of juncture are often known as the phenomena of sandhi. Among the Modern Indian Languages Tamil employs sandhi otherwise known as morphophonemic changes both in word internally and also between words which is often called the external snadhi. External sandhi is one of the most important and crucial phenomena that needs to be addressed by computational linguists. In Tamil whenever a pair of words are in a sequence and the first words ends an vowel and the second word begins in an obstruent (k-, c-, ṭ-, t-, p-) the consonant is doubled and the left of the geminated sequence goes to the preceding word and gets attached to the vowel forming a coda.

In the sequences like *pēravait talaivar, tamizp palkalaikkazakam, a̱ruvaic cikiccai, pāvaik kūttu* etc the first or the left most words have an extra explicit display of consonant (obstruent) which is the copy of the following words initial consonant. These so called morphophonemically changed words are now morphological non transparent and needs to recognized by morpholocal analyser. In the process, enclificized consonants shall be removed to get proper word forms.

Most frequently occurring four morphophonemic increments that occur with nouns and their percentage have been listed below:

Frequency	Sandhi	% Coverage to the extracted total frequencies
2609	k	44.08
1142	c	19.29
1092	t	18.45
1075	p	18.16

Table-17

Column Chart-2

One can observe from the above table is that among the top four morphophonemic changes introduced variants -*k* is more frequent with 2609 tokens with a coverage of 44%. The second place is by –*c* 1142 with tokens with a coverage of 19.29%. The third place is occupied by –*t*, with 1092 tokens and its with a coverage of 18.45% and fourth place by –*p* 1075 token with 18.16% converse.

3. 5 VERBS

Verbs are words which indicae actions, activities like *pār* 'see', *paṭi* 'read', *cey* 'do', *kuṭi* 'drink', *tūṅku* 'sleep', *kāttiru* 'wait' and *ezuntiru* 'get up'. Verbs are distinguished from other parts of speech by a number of properties. A verb might carry gender, number, person, tense, aspect and modality finiteness, and honorifisity. It can be marked for tense: *va**nt**ēn̲* (past tense), *varu**kir̲**ēn̲* (present tense), and *varu**v**ēn̲* (future tense). It can be marked for gender: *vant**atu*** (It came), *varukir̲**āḷ**,* (She is coming), *varuv**ān̲*** (He will come) and so on. A verb can usually be preceded by an adverb e.g.: *avaḷ metuvāka naṭantāḷ* (She walked slowly). Tamil verb forms are broadly classified into finite and non-finite. Finite verbs are marked for tense and person, number and gender (PNG). Verbs which are marked for PNG are always marked for tense, but some verbs are marked for tense but not marked for PNG. Such PNG-less, tense marked verbs are called non-finite verbs (Schiffman 1999).

For Example:

āku-v-ān̲ '(I) will become'

aḷi-tt-ār '(He/she) gave or offered'

an̲uppu-kir̲-ōm '(We) are sending'

cel-v-ēn̲ '(I) will go'

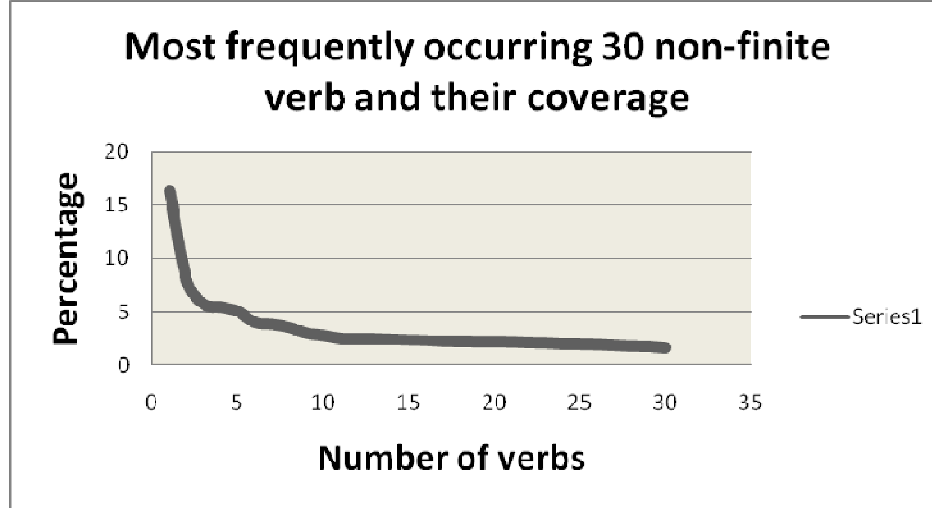

cey-tu-kkoṇṭu-iru-kkir̲-ēn̲ '(I) have been doing for myself'

Consider the following flow chart verbal conjugation, which displays the occurrence of the inflection of verbs of the Tamil language.

3. 5. 1 MOST FREQUENTLY OCCURRING 30 NON-FINITE FORMS OF VERBS AND THEIR PERCENTAGE IN THE CORPUS

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	15400	vēṇṭum	16.37096174
2	7449	koṇṭu	7.918655455
3	5358	uḷḷa	5.695819026

27	1747	vanta	1.857147413
28	1682	ēṟpaṭum	1.788049198
29	1654	toṭarntu	1.758283813
30	1542	eṭuttu	1.639222273

Table-18

XY (Scatter) with smooth line Chart-3

What one can notice from table-18 is that among the most frequent 30 verbs, the finite verb *vēṇṭum* has occupied the first place with the frequency of 15400 tokens and with a coverage of 2.18. This is followed by *koṇṭu* in the second place, which is an auxiliary verb/verbal participle with 7449 tokens. The non-finite/adjectival participle verb *uḷḷa* with finite verb *irukkum* have occupied the third and the fourth place with 5358 and 5113 tokens. Then the fifth place is by verbal participle/non-finite *ceytu* with 4729 tokens. When we consider the entire 30 words, three are infinitive *irukka* with 1958 tokens covering of 12.91%, *ceyya* with 2626 tokens of 9.59%, *koḷḷa* with 2797 covering of 9.05%, ten are verbal participles *koṇṭu* with 7449 tokens of 3.38%, *ceytu* with 4729 tokens of 6.03%, *vantu* with 3334 tokens of 8.13%, *viṭṭu* with 2181 tokens of 11.73%, *ceṉṟu* with 2086 tokens of 12.16%, *vaittu* with 2039 tokens of 12.51%, *iruntu* with 1927 tokens of 13.17%, *kaṇṭu* with 1847 tokens of 13.74%, *toṭarntu* with 1654 tokens of 14.80%, *eṭuttu* with 1542 tokens 15.66%, nine are adjectival participles, *uḷḷa* with 5358 tokens of 5.37%, *irukkum* with 5113 of 5.54%, *koṇṭa* with 2326 tokens of 10.75%, *ākum* with 2361 tokens of 10.59, *ceyyum* with 1859 tokens of 13.55%, *vēṇṭiya* with 1813 tokens of 13.86%, *vanta* with 1747 tokens of 14.34%, *ēṟpaṭum* with 1682 tokens of 14.69%, *eṉṉum* with 3597 tokens of 7.78%, seven are finite verbs *vēṇṭum* with 15400 tokens of 2.18%, *illai* with

3742 tokens of 7.17%, *uḷḷaṉa* with 2320 tokens of 10.90%, *uḷḷatu* with 2268 tokens of 11.13%, *irukkiṟatu* with 2217 tokens of 11.59%, *iruntatu* with 2028 tokens of 12.58%, *muṭiyātu* with 2013 tokens of 12.65%. Among the finite verbs the two wordforms as *illai* and *muṭiyātu* are negative verbs.

Sl. No.	Verb Types	Frequency	% Coverage to the extracted total frequencies
1	FUT ppl	30012	31.904
2	PST ppl	28788	30.603
3	ADJ ppl	11244	11.952
4	NEG NON-FINITE	5755	6.117
5	INF	7381	7.846
6	FINITE	8833	9.389
7	ROOT VERB	2056	2.19%

Table-18(a)

Among the 30 non-finite forms, the future participles are most frequent with 30012 tokens with a coverage of 31.9% then followed be past participle with 28788 token with a coverage of 30.60%. The third place is by adjectival participle with 11244 tokens with a coverage of 11.95%. These three types of verbs are more frequent than other types in Tamil.

3. 5. 2 FREQUENTLY OCCURRING 30 FINITE VERBAL FORMS AND THEIR PERCENTAGE

Most frequently occurring thirty finite forms of verbs and their percentages have been listed below from the corpus.

Sl. No.	Frequency	Words	% Coverage to the extracted total frequencies
1	2217	irukkiṟatu	16.74850797
2	2028	iruntatu	15.32069200

27	161	vantāḷ	1.216287678
28	153	kuṟaintatu	1.155851024
29	148	cērntatu	1.118078114
30	147	iruntāṉ	1.110523533

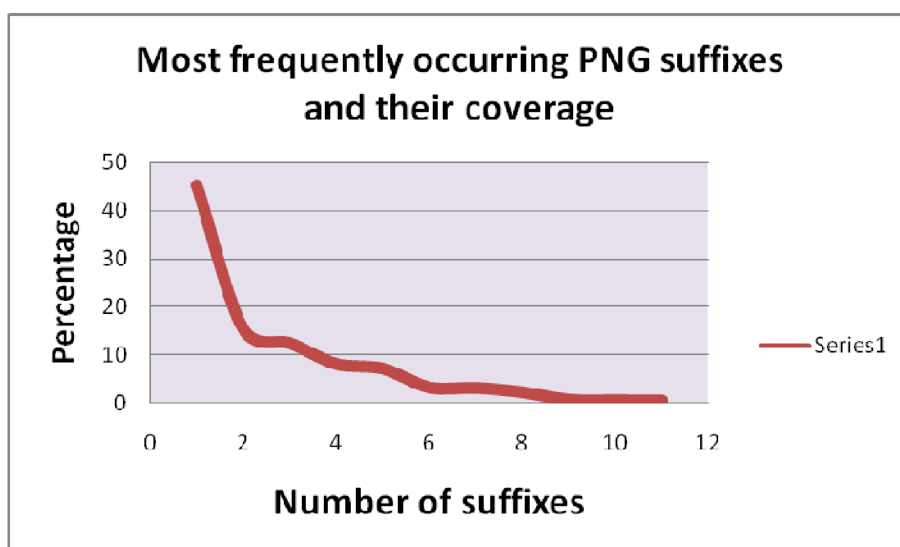

Table-19

Among top 30 finite verbs, 14 verbs end with *-atu*, which is an 3.sg. neutral marker and nine verbs end in *-ār* which is a 3.sg. mas./fem. epicene maker as well as honorific marker; out of nine verbs four verbs end in - *ārkaḷ* after 3.sg. marker *-āṉ* and three verbs end with *-āṉ* which is a 3.sg. masculine marker. These two verb also end in *-aṉa* which is a 3.pl. neutral marker. One verb ends in *-ēṉ*, which is 1.sg. marker. There is a line finite verb ending in *-āḷ* which is a 27 fem.sg. form. Among all these 30 verbs, this verb *irukkiṟatu* is the only verb, which comes with 2217 tokens among inflected verbs and in the same way least number of tokens are presented by *iruntāṉ*, which is a 3.sg. with 147 tokens.

3. 5. 2. 1 Most Frequently Occurring PNG Markers and their Coverage

Sl. No.	PNG	Form ending	Frequency	% Coverage to the extracted total frequencies
1	3ns	-atu	2217	45.27%
2	3sh	-ār	759	15.49%
3	3np	-aṉa	616	12.57%

5	3ms	-āṉ	356	7.26%
6	1s	-ēṉ	165	3.36%
7	3fs	-āḷ	161	3.28%
8	2p	-tōm	116	2.36%
9	2sh	-tīr	40	0.81%
10	2s	-āy	33	0.67%
11	2ph	-tīrkaḷ	30	0.61%

Table-20

XY (Scatter) with smooth line Chart-4

3. 5. 3 AUXILIARIES

Auxiliary verbs come after the root of the main verb inflected for, infinitive or adverbial participle or completive or conjunctions participle. Auxiliary verbs

are defined as verbs, which lose their original syntactic and semantic properties when they collocate with other verbs and signify various grammatical functions. For example;

maṇi eṅkē irukkiṟāṉ? "Where is Mani?" The verb iru- is used as main verb.

Mani where be-prs.3pm.s

maṇi iṅkē vantirukkiṟāṉ. "Mani has come here" Here the auxiliary iru follows main verb

Mani here come-cp-be-prs.3pms in its easy verb.

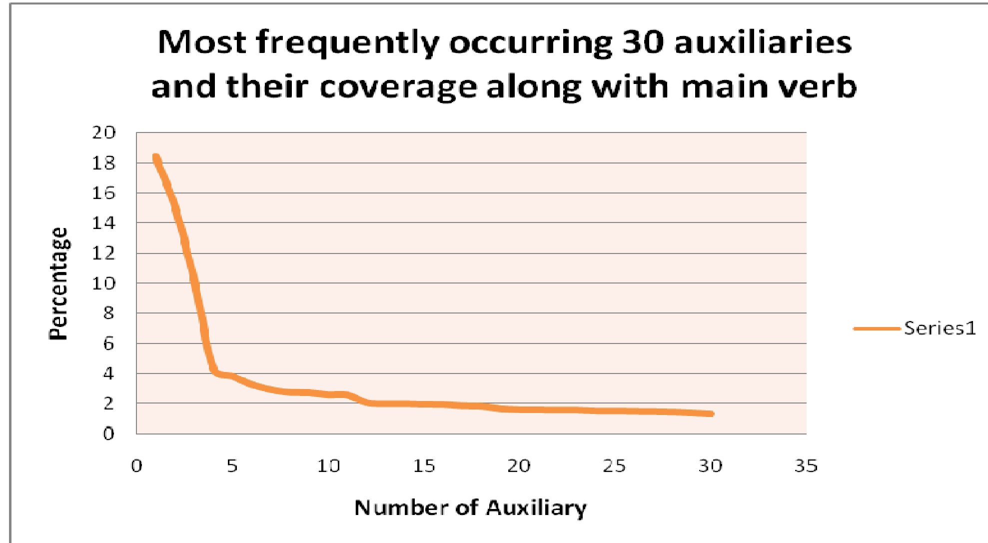

The verbs, which thus become auxiliaries, may also function like full verbs elsewhere, resulting in formally being identical but functionally different pairs of verbs. The difference is manifested in their alternate syntactic distribution and semantic denotation. The function of an auxiliary in any language is to express the voice, mode, tense or aspect of the action denoted by the main verb of a sentence.

Auxiliary verbs have various names. Walther, 1739, Pope, 1859, Arden 1891, Agesthialingom, 1964, Meenakshisundaram, 1965, Isreal, 1976, Karthikeyani, 1976, Srinivasan, 1976, Joseph, 1981 and Steever, 1983 addressed this as auxiliary verbs. Bahl, 1967 termed this as explicator. Hook, 1974 mentioned this as a compound Verb. Subbarao, 1979 called this as secondary verb. Bhat, 1979 termed this as vector. Kachru (1993) points out this as serial verbs so on.

Sl. No.	Frequency	Main verb	Auxiliary verb	% Coverage to the extracted total frequencies
1	1327	koḷḷa	vēṇṭum	18.41265436
2	1087	irukka	vēṇṭum	15.08255862

28	102	vara	vēṇṭum	1.415290690
29	98	irukka	muṭiyum	1.359789094
30	93	eṭukka	vēṇṭum	1.290412099

Table-21

XY (Scatter) Chart-12

Among 30 compounds verbs, *koḻḻa vēṇṭum* is the most frequent sequence with 1327 tokens compared to others. The least frequent one is *eṭukka vēṇṭum* with 93 tokens. Out of 30 auxiliaries, *vēṇṭum* is more frequent one. It has occurred

15 tokens with different verbs and among other verbs there are *koṇṭu, koḷḷa, muṭiyum, pōy* etc. One can observe by comparing table-18 and table-19 that finite verbs are less frequent than non-finite verb in Tamil. The above XY (Scatter) Chart-3 represented by table-21 where it shows that the first most frequent 30 auxiliaries have little more than 1.20% coverage in the corpus. It also can be said that because non-finite verb forms have high frequency the Tamil language employs compound verb constructions very frequently. Therefore, high frequency of compound verbs necessitates the use of non-finite verbs.

3. 5. 4 SEQUENCES OF TWO AUXILIARIES WITH MAIN VERB AND THEIR PERCENTAGE

The auxiliary verbs in Tamil can be stacked, having more than one auxiliary verb in a structure. We shall see the co-occurrence of auxiliaries with various formatives of the main and auxiliary verbs in the table-22 below.

Sl. No.	Frequency	Main verb	Auxiliary1	Auxiliary2	% Coverage to the extracted total frequencies
1	150	vaittuk	koḷḷa	vēṇṭum	16.04278075
2	91	eṭuttuk	koḷḷa	vēṇṭum	9.732620321
3	74	ceytu	koḷḷa	vēṇṭum	7.914438503
4	73	terintu	koḷḷa	vēṇṭum	7.807486631
5	67	pārttuk	koḷḷa	vēṇṭum	7.165775401
6	36	cērttuk	koḷḷa	vēṇṭum	3.850267380
7	32	aṟintu	koḷḷa	vēṇṭum	3.422459893
8	30	vaittu	viṭa	vēṇṭum	3.208556150
9	26	cēkarittuk	koḷḷa	vēṇṭum	2.780748663
10	24	purintu	koḷḷa	muṭiyum	2.566844920
11	22	naṭantu	koḷḷa	vēṇṭum	2.352941176
12	22	purintu	koḷḷa	vēṇṭum	2.352941176
13	20	kalantu	koḷḷa	vēṇṭum	2.139037433
14	20	terintu	koḷḷa	vēṇṭiyatu	2.139037433
15	19	payaṉpaṭuttik	koḷḷa	vēṇṭum	2.032085561
16	19	koṇṭē	irukka	vēṇṭum	2.032085561
17	18	koṇṭu	vara	vēṇṭum	1.925133690
18	17	eṭuttu	vaittuk	koḷḷa	1.818181818

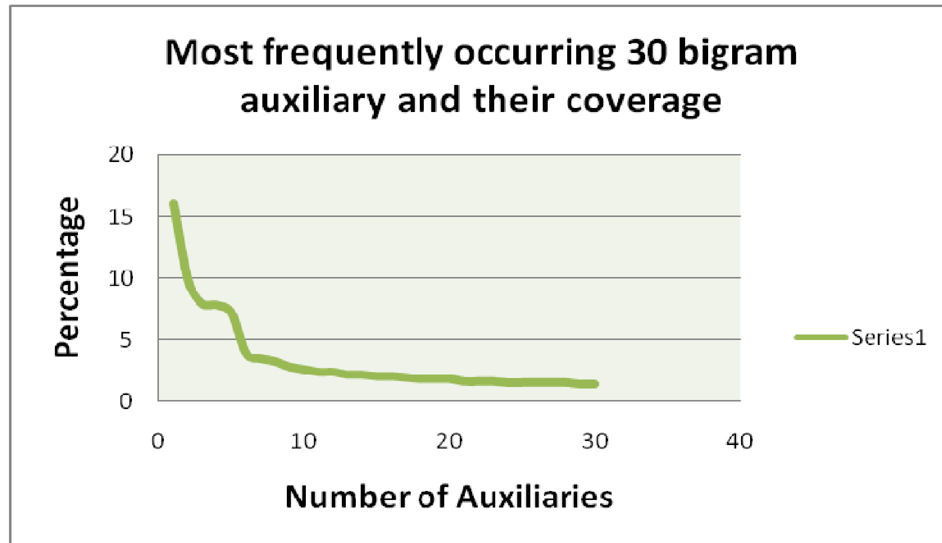

19	17	aṉuppi	vaikka	vēṇṭum	1.818181818
20	17	kavaṉittuk	koḷḷa	vēṇṭum	1.818181818
21	15	mūṭi	vaikka	vēṇṭum	1.604278075
22	15	eṭuttu	vaikka	vēṇṭum	1.604278075
23	15	amaittuk	koḷḷa	vēṇṭum	1.604278075
24	14	iṟakki	viṭa	vēṇṭum	1.497326203
25	14	ēṟṟuk	koḷḷa	vēṇṭum	1.497326203
26	14	pōṭṭuk	koḷḷa	vēṇṭum	1.497326203
27	14	vēṇṭumeṉṟu	kēṭṭuk	koḷkiṟēṉ	1.497326203
28	14	naṟukki	vaittuk	koḷḷavum	1.497326203
29	13	aṭukki	vaikka	vēṇṭum	1.390374332
30	13	kalantu	vaittuk	koḷḷavum	1.390374332

Table-22

What we observe from table-22 is that the most frequently occurring sequence of two auxiliaries preceded by main verb have been listed. Among these sequences *koḷḷa vēṇṭum* is the most frequent where compare to other auxiliaries. Next to *koḷḷa vēṇṭum, viṭa vēṇṭum, irukka vēṇṭum, vara vēṇṭum, vaittuk koḷḷa, vaikka vēṇṭum, viṭa vēṇṭum* are frequent. They have the following structure:

1. MV+CP – AV_1+Inf. – AV_2 + FIN infl.

2. MV+CP – AV_1+CP – AV_2 + FIN Infl.

XY (Scatter) Chart-13

In the XY (Scatter) Chart-4 the most frequently occurring 30 trigrams or sequences of 3 verbs. The percentage graph shows sequences of two auxiliaries that have occupied little more than 0.25% coverage in the corpus. First ten verbs have 0.10% coverage in the corpus. Similarly if we take another ten i.e. twenty verbs these would be 0.15% coverage in the corpus.

3. 5. 5 TENSE SUFFIXES

Various verb stems and their different inflectional morphemes have been classified as in the following. Finite verbal inflections in Tamil involving tense suffixes, and gender number person (PNG) suffixes and a similar other verbal categories in the corpus and their coverage have been studied.

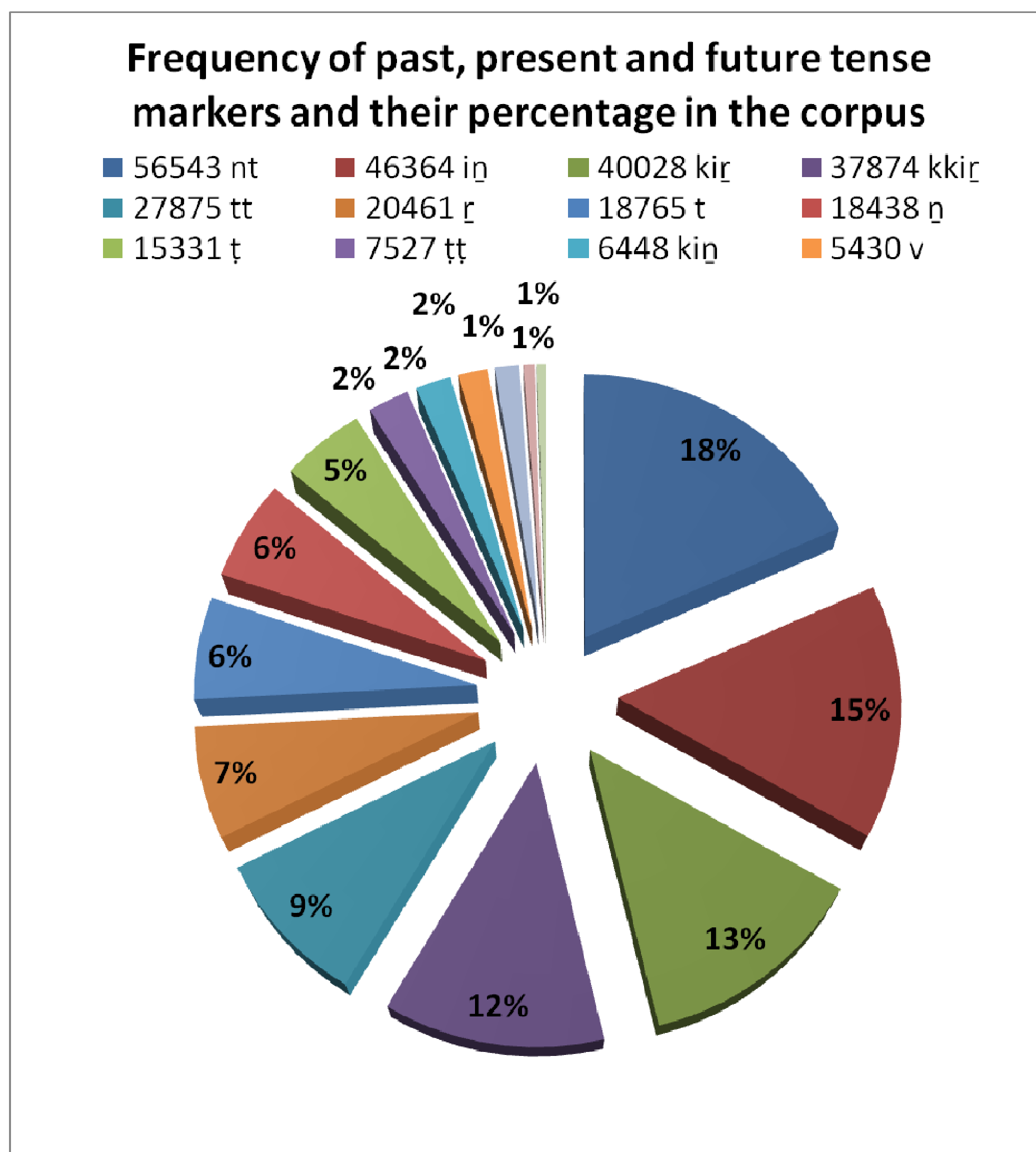

The first inflectional suffixes of various verbal categories after the verb stem are tense markers. It could be any tense such as present tense *–kiṟ*, with the allomorphs *-kiṟ-*, *-kkiṟ-* and*–kiṉṟ-*, *-kkiṉṟ-*; past tense *-t* has allomorphs such as *-t-*, *-ṟ-, -nt*, *-iṉ-*, *-ṭ-*, *-tt-* and finally future tense *-v* has allomorphs such as *-v-*, *-p-*, *-pp-* and the future suffix *–um*.

Frequencies of tense markers along with their percentage from the corpus been listed below:

Sl. No.	Frequency	Tense markers	% Coverage to the extracted total frequency of tense marker	% Coverage to the total corpus
1	56543	nt	18.28	1.88
2	46364	iṉ	14.99	1.54
3	40028	kiṟ	12.94	1.33
4	37874	kkiṟ	12.25	1.26
5	27875	tt	9.01	0.92
6	20461	ṟ	6.61	0.68
7	18765	t	6.06	0.62
8	18438	ṉ	5.96	0.61
9	15331	ṭ	4.95	0.51
10	7527	ṭṭ	2.43	0.25

11	6448	kiṉṟ	2.08	0.21
12	5430	v	1.75	0.18
13	4476	pp	1.44	0.14
14	1976	kkiṉṟ	0.63	0.06
15	1632	p	0.52	0.05
Total			309168	3000000

Table-23

Pie Chart-1

There are three tense markers in Tamil vi.z as past, present and future. All these three tenses altogether have some 15 alternant. Out of these fifteen

alternant, the past tense markers *-nt* with 56543 tokens and *-iṉ* with 46364 tokens occupied the first two places. Followed by the past tense markers, the present tense markers have occupied second place *-kiṟ* with 40028 tokens and *-kkiṟ* with 37874 tokens. Among the present tense markers these two *-kiṉṟ* with 6448 tokens *-kkiṉṟ* with 1976 tokens are the alternant of the present tense marker *-kiṟ*. The future tense marker is less frequent compare to the two past and present tense markers. The future tense marker *-v* with 5430 tokens has *-p* with 1632 tokens and *-pp* with 4476 tokens as alternant. You can see all the tenses and their different alternant with frequency and their percentage from the corpus been listed here. Even the above pie chart-1 represents the same of table-23.

3. 5. 6 MOST FREQUENTLY OCCURRING 25 VERB ROOTS AND THEIR PERCENTAGE IN THE CORPUS

Sl. No.	Frequency	Words	Coverage within 25 verb roots frequencies	% coverage to the total corpus
1	13195	iru	19.69	0.43
2	9806	vā	14.63	0.32
3	4625	koḷ	6.90	0.15
4	4012	kāṇ	5.98	0.13
5	3845	cey	5.73	0.12
6	3360	vai	5.01	0.11
7	3187	viṭu	4.75	0.1
8	3003	eṭu	4.48	0.1
9	2175	eṉ	3.24	0.07
10	2013	muṭi	3.00	0.06
11	1828	cēr	2.72	0.06
12	1682	ēṟpaṭu	2.51	0.05
13	1644	kuṟippiṭu	2.45	0.05
14	1438	pōṭu	2.14	0.04
15	1225	pō	1.82	0.03
16	1161	pār	1.73	0.03
17	1150	kala	1.71	0.03
18	1090	kiṭai	1.62	0.03
19	1083	peṟu	1.61	0.03

20	956	teri	1.42	0.03
21	937	aṟi	1.39	0.03
22	937	cel	1.39	0.03
23	907	nil	1.35	0.03
24	901	koṭu	1.34	0.03
25	839	miku	1.25	0.02

Table-24

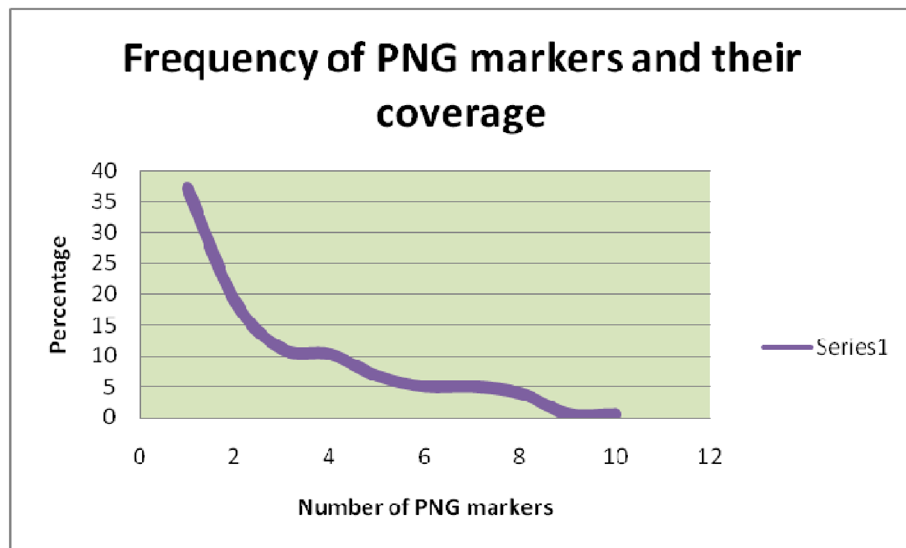

High frequency verb roots have both lexical and functional importance. They are more more polysemous than less frequent verb roots. One can observe from the above table-24 is that out of 25 verb roots *iru* is most frequent one with 13195 tokens along with 19.69 percentage. It can functions both main and auxiliary verb. The verb root *iru,* is a polysemous verb root. The second verb is *vā* which can function as main and auxiliary verb with 9806 tokens with 14.63 percentage. The less frequent verb roots among the twenty-five verb root is *miku* 'increase' with 839 tokens with 1.25%. Out of the 25 verbs, 17 verbs are polysemous they are *iru, vā, koḷ, cey, vai, viṭu, eṭu, muṭi, cēr, pōṭu, pō, pār, peṟu, and teri.* Those verbs which show higher frequencies are also function as auxiliaries as the above list shows. Similarly verbs which function as verbalizer in the sequences NV compounds or conjunctive verbs such cey, eṭu etc.

3. 5. 7 PERSON NUMBER GENDER (PNG) MARKERS

PNG marker, which stands for person number and gender, is the last inflectional suffixes following the affixes of tense, aspectual and modal categories. Person is classified into three such as first person, second person and third person. The first person is further divided into first person singular *–ēṉ*, and first person plural inclusive has two values and exclusive plural marker *-ōm*. The second person singular represented by *–āy*, second singular honorific-1, *-īr*, honorific-2 *-īrkaḷ* and second person plural *-īrkaḷ.* The third person is also further divided into masculine singular *-āṉ*, feminine singular -*āḷ*, honorific human singular *–ār*, human plural *-ārkaḷ*, non-human singular –*atu* and non-human plural *-aṉa*.

Frequency	PNGs	% Coverage to the extracted total frequencies
2217	-atu	37.25
1122	-ār	18.85
665	-āṉ	11.17
616	-aṉa	10.35
404	-ārkaḷ	6.78
306	-ōm	5.14
304	-āḷ	5.10
239	-ēṉ	4.01
40	-īrkaḷ	0.67
38	-āy	0.63

Table-25

XY (Scatter) Chart-14

Among the PNG markers, the third person neuter singular *-atu*, 37,25% of the corpus with 2217 tokens. Followed by the suffix *–ār*, the 3p singular honorific marker masculine/feminine has 18.85% coverage with 1122 tokens; then the suffix *-āṉ*, which is 3p singular masculine displaying 11.17% with 664 tokens. The fourth place is by the suffix *-aṉa*, which is 3p neuter plural marker, chaving the coverage 10.35% with 616 tokens etc. Thus, the PNG suffixes have distributed with distinct frequency along with their percentage in the corpus.

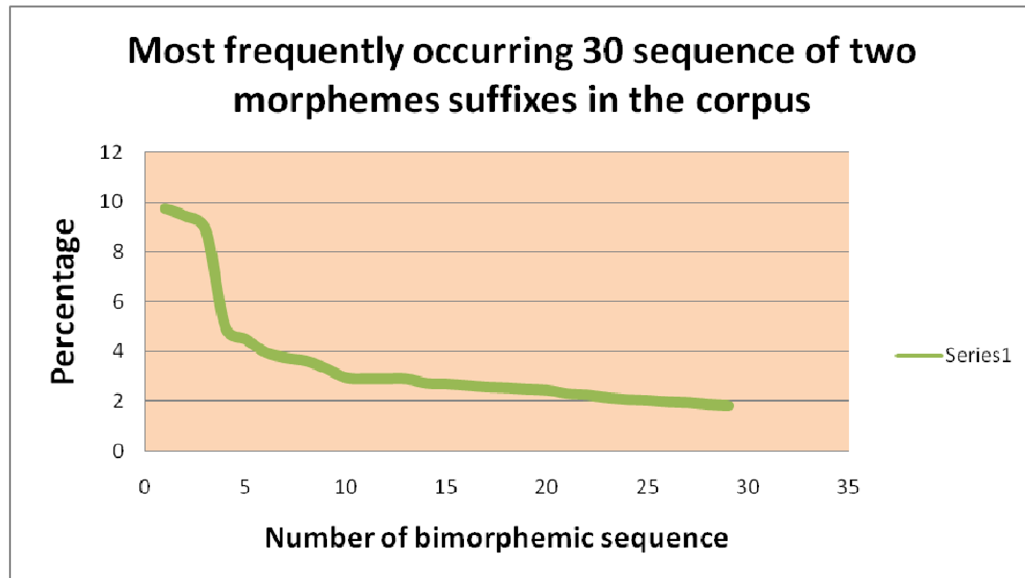

3. 5. 8 MOST FREQUENTLY OCCURRING 30 BIMORPHEMIC SEQUENCES OF SUFFIXES IN THE CORPUS

Sl. No.	Frequency	Morpheme bigram	% Coverage to the extracted total frequencies
1	2217	kkiṟ-atu	9.754487856
2	2147	tt-il	9.446497712
3	2028	nt-atu	8.922914467
4	1122	ṟ-ār	4.936642027
5	1019	kkaḷ-iṉ	4.483456529
6	899	kaḷ-il	3.955473425
7	849	kkiṉṟ-aṉa	3.735480465
8	821	nt-āl-um	3.612284407
9	751	kaḷ-ukku	3.304294263
10	665	ṟ-āṉ	2.925906371
11	656	kiṉṟ-aṉa	2.886307638
12	656	kaḷ-iṉ	2.886307638
13	655	t-ār	2.881907779
14	616	nt-aṉa	2.710313270
15	610	pp-atu	2.683914115
16	596	ṇṭ-ār	2.622316086
17	581	kiṟ-atu	2.556318198
18	574	iṉ-ār	2.525519183
19	562	kaḷ-uṭaiya	2.472720873
20	553	ai-y-um	2.433122140
21	518	ṭṭ-ār	2.279127068
22	508	kaḷ-ai	2.235128476
24	483	ṉṉ-ār	2.125131996
25	468	kkaḷ-ukku	2.059134108
26	461	tt-iṉ	2.028335093
27	445	nt-aṉar	1.957937346
28	438	nt-āl	1.927138332
29	420	tt-āl	1.847940866
30	410	ṉṟ-ār	1.803942274

Table-26

What one can observe from table-26 is that *-kkiṟ-atu* combinations are more frequent with 2217 tokens with a coverage of 9.75 percent occupying first place than any other combination in the corpus. This is a present tense marker with 3p neuter singular suffix. The second place occupied by *-tt-il*

combination with 2147 tokens with 9.44%. Out of 20 verbal combinations, the three are *-kkiṟ, -kiṉṟ and -kkiṉṟ* variants of present tense marker *-kiṟ*. Past tense marker is represented by variants such as *–nt, -ṟ, -t, -ṇṭ, -iṉ, -ṭṭ, -ṉṉ*, and *-ṉṟ* out. Out of the 30 combination seven are based on -kaḷ and three are case markers attached to the single form of the stem like –tt-il, -tt-āl and -tt-iṉ.

XY (Scatter) Chart-16

The XY Scatter chart-6 represents the above table-26 revealing that the most frequently occurring 30 sequences of bimorphemeic inflections in Tamil are distributed between the range of 10% and 30%. If we observe the percentage of the word, not even single bimorphemic inflection occurs within 10% of words frequency in the corpus.

3. 6 PRONOUNS

As Lehmann (1989:18) states that pronouns are a closed subset of the parts of speech of nous. The property, which groups pronouns as a subset of nouns is largely syntactical. A pronoun is often defined as a word that can substitute for a noun or noun phrase (or clause) or words of similar types. Pronouns are referential as well as anaphoric by nature, i.e., they refer back to something

previously expressed (linguistic antecedent) either in the sentence or in the discourse.

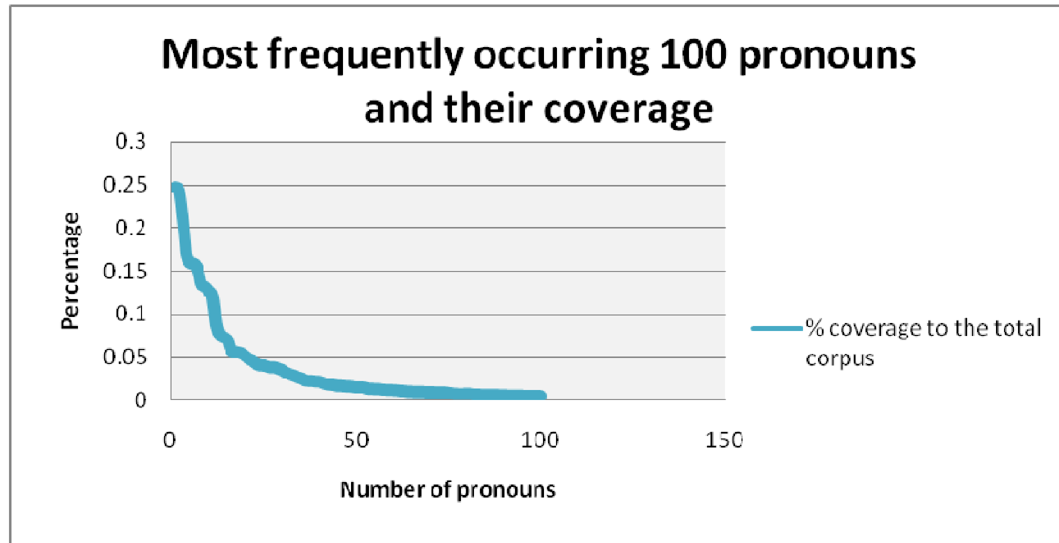

3. 6. 1 FREQUENCY OF 100 PRONOMINAL FORMS AND THEIR COVERAGE IN THE CORPUS

Sl. No.	Frequency	Pronouns	% Coverage to the extracted total frequencies	% Coverage to the total corpus

100	170	tamakku	0.151082909	0.005666667

Table-27

XY (Scatter) Chart-16

The above table-27 reveals that the pronouns in Tamil and their frequencies along with their coverage were listed. Among 100 pronouns forms, this pronoun *avar*, which is honorific pronoun of 3p masculine/feminine has the highest frequency with 7405 tokens with a coverage of 5.5486% in the extracted total frequencies and 0.2468% in the total corpus. The last one is tamakku with 170 tokens with a coverage of 0.1510% in the extracted total frequencies and 82909% in the total corpus. Among the case markers, the *–ai* accusative is the most frequent with 22 times occurred with differne pronoun forms such as *ataṉai*, *avaḷai*, *avaṉai*, *avaṉaip*, *avarai*, *avaraip*, *avaṟṟai*, *avaṟṟaip*, *eṉṉai*, *eṉṉaik*, *eṉṉaip avarai*, *avaraip*, *avarkaḷai*, *avaṟṟai*, *avaṟṟaip*, *eṉṉai*, *eṉṉaik eṉṉaip*, *itaṉai*, *ivaṟṟai* and *taṉṉai*. The ten tokens are having the *–ku* and *-ukku* as dative case marker such as *ataṟku*, *ataṟkuk*, *ataṟkup*, *avaḷukku avaṉukku*, *avarkaḷukku*, *avarukku*, *avarukkup*, *itaṟku* and *itaṟkuk*. The senven tokens are having the *-uṭaiya* as genitive case marker such as *avaḷuṭaiya*, *avaṉuṭaiya*, *avarkaḷuṭaiya*, *avaruṭaiya*, *eṉṉuṭaiya*, *tammuṭaiya*, *taṉṉuṭaiya* and six tokens are having *–atu* as genitive case marker like *avaḷatu*, *avaṉatu*, *avaratu*, *avarkaḷatu*, *ivaratu*, *tamatu*. These five tokens *atil*, *atilum*, *avaṟṟil*, *itil*, *ivaṟṟil* are having *-il* as locative case marker. These three words (pronoun) *avarkaḷiṉ*, *avaṟṟiṉ*, *ivaṟṟiṉ* takes are having *-iṉ* as genitive case marker and two words *avariṭam*, *eṉṉiṭam*

are having *-itam* as locative case marker. When we compare this table with noun tabl we can understand that the locative case marker *–il* is most frequent with noun and –ai is most frequent with pronoun.

3. 7 ADJECTIVES

Adjectives are words, which qualify nouns. Adjectives are of two types such as a simple adjectives and a derived adjectives. The simple adjectives are the ones, which are not descriptively derived from any other grammatical category (Kodandaraman, P. 1997:79). Besides verbs and nouns, adjectives are small in number in Tamil. See the following simple adjectives such as *nalla* 'good', *iṉiya* 'sweet', *periya* 'big' *ciṉṉa* 'small', *ciṟiya* 'small', *putu* 'new', *putiya* 'new', *pazaiya* 'old', *ariya* 'rare' and so on. Most other adjectives are either derived from verb roots for example, *keṭṭa* 'bad', which in morphological terms is the past relative participle of *keṭu* 'get spoiled' or formed by adding one of two adjectivalizing suffixes.

3. 7. 1 SIMPLE ADJECTIVES AND THEIR FREQUENCIES IN THE CORPUS

Sl.No.	Frequency	Adjectives	% Coverage to the extracted total frequencies
1	2772	periya	27.11798083
2	2694	nalla	26.35492076
3	2130	putiya	20.83740951
4	1176	ciṟiya	11.50459793
5	922	pazaiya	9.019761299
6	291	ariya	2.846801017
7	237	iṉiya	2.318528664

Table-28

Table-28 displays seven simple adjectives with their frequencies. These adjectives can be classified in many ways expressing their opinion, size, age,

shape, color, origin, material, purpose etc. This adjective *periya* 'big' is the most frequent one among the simple adjectives occurring with 2772 tokens with a coverage of 27.11%. Then the adjective *nalla* 'good' occurs with 2694 tokens and with a coverage of 26.35%. The third place is by *putiya* 'new' which occurrs in 2130 tokens with 20.83%. The adjective iṉiya with a coverage of 2.31 and so on.

3. 7. 2 MOST FREQUENTLY OCCURRING 30 DERIVED ADJECTIVES AND THEIR FREQUENCIES WITH COVERAGE

Sl.No.	Frequency	Derivational Adjectives	% Coverage to the extracted total frequencies
1	824	cariyāṉa	11.51320386
2	654	mukkiyamāṉa	9.137906944
3	490	vakaiyāṉa	6.846444041
4	442	atikamāṉa	6.175771971
5	430	uṇmaiyāṉa	6.008103954
6	383	potuvāṉa	5.351404220
7	364	kaṭumaiyāṉa	5.085929859
8	285	viññāṉa	3.982115411
9	281	vitamāṉa	3.926226072
10	273	ērāḷamāṉa	3.814447394
11	271	azakāṉa	3.786502725
12	268	nilaiyāṉa	3.744585720
13	266	ciṟappāṉa	3.716641051
14	261	perumpālāṉa	3.646779377
15	253	kuṟaivāṉa	3.535000699
16	250	toṭarpāṉa	3.493083694
17	245	pōtumāṉa	3.423222020
18	213	tavaṟāṉa	2.976107308
19	156	payaṉuḷḷa	2.179684225
20	96	aḷavuḷḷa	1.341344139
21	65	uyiruḷḷa	0.908201761
22	64	nīḷamuḷḷa	0.894229426
23	59	eṭaiyuḷḷa	0.824367752
24	42	niṟamuḷḷa	0.586838061
25	40	taṉmaiyuḷḷa	0.558893391

26	40	atikamuḷḷa	0.558893391
27	38	matippuḷḷa	0.530948722
28	37	kīzuḷḷa	0.516976387
29	34	an̲puḷḷa	0.475059382
30	33	uyaramuḷḷa	0.461087048

Table-29

In Tamil, the derivational adjectives are made by adding one of the two adjectival markers *–ān̲a* or *-uḷḷa* to a bare noun. In certain case this *–ān̲a* can be replaced by *-uḷḷa* and some case by *-uṭaiya* also (For example, *an̲pu* + *ān̲a* = *an̲pān̲a, an̲pu+uḷḷa =an̲puḷḷa, an̲pu+uṭaiya =an̲puṭaiya ammā* 'loving mother'). The two adjectivalizing suffixes *-ān̲a* 'that which is/was' (historically the past relative participle of *-āku* 'become') and *-uḷḷa* 'that which has' (the relative participle of the verb *'uḷ'* 'be, exist' are added to nouns to derive ajectives in reduced relative clauses, *azaku* 'beauty' : *azakān̲a* 'beautiful', *an̲pu* 'love' : *an̲puḷḷa ammā* (loving mother) (cf. Asher, R.E. 1982).

What one can observe from the above table-30 is that among the derivational suffixes *-ān̲a*, *-uḷḷa* and *-uṭaiya t*he suffix *-ān̲a* is the most frequent one when compared to its others and *-uṭaiya* is very less frequent one when compared to others *-ān̲a*, and *-uḷḷa.* The suffix *-uṭaiya* does not occur even once within 30 most frequent derivational adjectives in the above table. It comes after bit later occurring 33 tokens as *pir̲aruṭaiya* 'someone else' with 0.46%. The word *an̲puṭaiya* 'having love' has occurred only once with 98.52% in the corpus. The derived adjectives are less frequent in their occurrence but more in number whereas simple non-derived adjectives are fewer in number but with higher coverage.

3. 8 ADVERBS

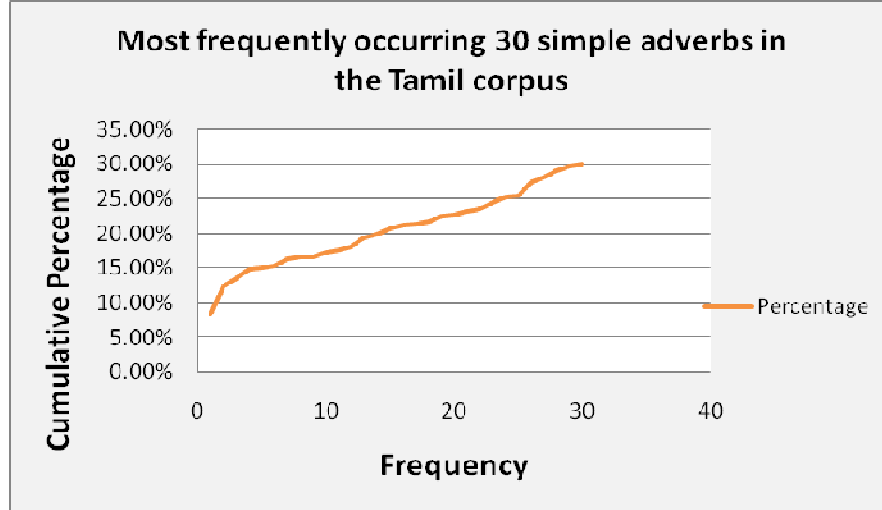

Adverbs are words, which qualify verbs. Adverbs are of two types simple adverb and derived. The simple adverbs are those, which are not derived from any other grammatical category (Kodandaraman, P. 1997). For example,

the following are simple adverbs, distributed with distinct frequencies from the corpus.

3. 8. 1 FREQUENTLY OCCURING 30 SIMPLE ADVERBS AND THEIR PERCENTAGE IN THE CORPUS

Sl.No.	Frequency	simple adverb	% Coverage to the extracted total frequencies
1	3122	piṟaku	9.563193040
2	2071	ivvāṟu	6.343809349
3	1858	piṉṉar	5.691355756
4	1654	toṭarntu	5.066470624
5	1619	iṉṟu	4.959259940
6	1584	eppaṭi	4.852049256
7	1439	ippōtu	4.407890706
8	1418	mīṇṭum	4.343564296
9	1392	iṉṉum	4.263922073
10	1305	iṅku	3.997426944
11	1260	uṭaṉē	3.859584635
12	1171	appōtu	3.586963181
13	1025	aṅku	3.139741469
14	987	ippaṭi	3.023341298
15	918	aṉṟu	2.811983091
16	884	aṅkē	2.707835569
17	870	evvāṟu	2.664951296
18	857	iṅkē	2.625130184
19	789	avvāṟu	2.416835141
20	781	appaṭi	2.392329841
21	733	appaṭiyē	2.245298046
22	727	koñcam	2.226919071
23	660	appozutu	2.021687190
24	610	ippozutu	1.868529069
25	604	arukil	1.850150095
26	521	eppōtum	1.595907615
27	492	ōraḷavu	1.507075905
28	456	eṅkē	1.396802058
29	424	iṉṟum	1.298780861
30	415	taṟpōtu	1.271212400

Table-30

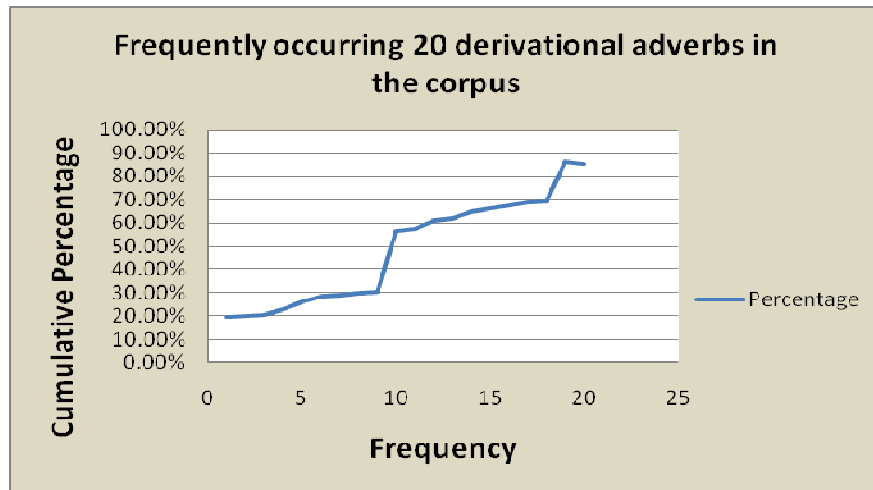

XY (Scatter) Chart-17

In terms of word formation, adverbs fall into two groups as mentioned earlier: simple adverbs and derivative adverbs. Simple adverbs are those that consist of only one free morpheme see the table above 31. If we take first 10 words from the table, seven are *piṟaku, piṉṉar, toṭarntu, iṉṟu, ippōtu, mīṇṭum* and *iṉṉum* are adverbs of time. The next two adverbs *ivvāṟu* and *eppaṭi* adverbs of manner. The adverb *iṅku* is an adverb of place. In the same manner if we look at next ten words i.e. from 11-20 we can see that three words *uṭaṉē, appōtu, aṉṟu* belong to the adverbs of time and the next adverbs *aṅku, aṅkē, iṅkē* are adverbs of place. Again the four words *ippaṭi, evvāṟu, avvāṟu, appaṭi* are adverbs of manner. If we consider both the first and second part, one can understand that words belong to adverb of tokens have occupied more frequently and in the second part, adverbs of manner have stood the first place. Likewise, if we think of the entire table, the adverbs have distributed into different classification such as manner of adverbs, place of adverbs, tokens of adverbs, and degree of adverb such as *koñcam, ōraḷavu* among the simple adverbs.

3. 8. 2 MOST FREQUENTLY OCCURRING 20 DERIVED ADVERBS IN THE CORPUS

Sl.No.	Frequency	Derivational adverb	% Coverage to the extracted total frequencies
1	1008	potuvāka	16.13316261
2	971	kāraṇamāka	15.54097311
3	927	atikamāka	14.83674776
4	747	naṉṟāka	11.95582586
5	582	vaziyāka	9.314980794
6	464	utāraṇamāka	7.426376440
7	454	kuṟippāka	7.266325224
8	419	cariyāka	6.706145967
9	397	ciṟappāka	6.354033291
10	51	atikamāy	0.816261204
11	49	naṉṟāy	0.784250960
12	36	oṉṟāy	0.576184379
13	33	kāraṇamāy	0.528169014
14	26	camamāy	0.416133163
15	23	azakāy	0.368117798
16	20	vēkamāy	0.320102433
17	18	talaivarāy	0.288092190
18	17	koṇṭatāy	0.272087068
19	3	vaḷamuṟac	0.048015365
20	3	poruttamuṟa	0.048015365

Table-31

XY (Scatter) Chart-18

The derivative adverbs are those that are derived from nouns by adding the suffix *-āka*, *-āy* and *-muṟa* e.g. *vēkam-āka* 'fast-adv.', *aṉp-āy* 'love-adv.' and *porutta-muṟa* 'appropriateness-adv.' (*uṭal ārōkkiyam cemmaiyāka iruntāltāṉ maṉamum vaḷamuṟa irukkum.* 'If body is in the healthy condition then only mind also will be wealth') etc. Table-32 displays 20 derivational adverbs with different frequencies along with their cumulative percentage from the corpus. Out of 20 derivational adverbs first 9 words end in *-āka* the adverbial derivative suffix, the next 9 words end in *-āy* the alternant derivational suffix and the last 2 words end in *-muṟa* another alternant derivational suffix. Among all the derived adverbs, a great majority of adverbs are derived from noun by adding *–āka.* Noun+*āka* combinations are more in number than noun+*āy* and noun+*muṟa* types. The noun+*muṟa* type of adverbs are rare in the corpus than noun+*āy*. One can also observe the XY (Scatter) Chart-10, which represents the same in graphics form.

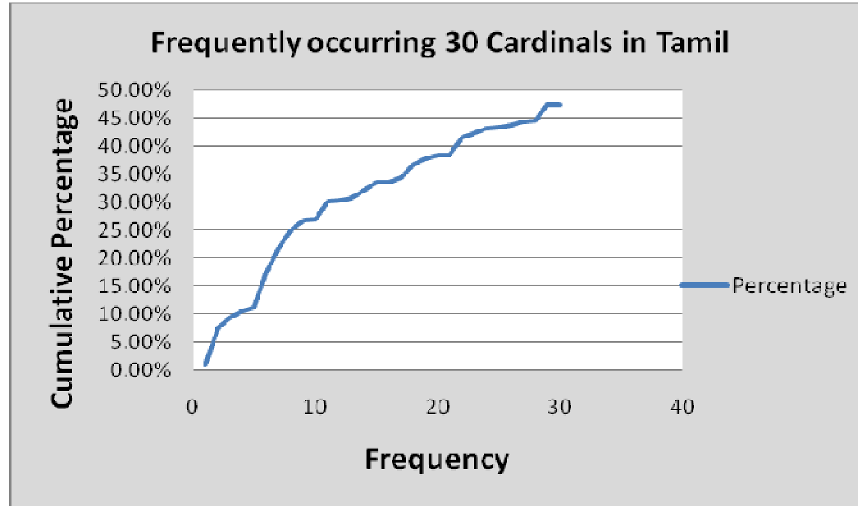

3. 9 NUMBER WORDS

Tamil distinguishes cardinal and ordinal numerals. Tamil numerical system has the numerals 1 to 10, 100, 1000, 100,000, and 10,000,000 etc.

Sl. No.	Frequency	Tamil Cardinals	% Coverage to the extracted total frequencies
1	27527	oru	58.76563768
2	3665	iraṇṭu	7.824174886
3	2661	oṉṟu	5.680799283
4	2401	orē	5.125741856
5	2275	mūṉṟu	4.856752487
6	1269	nāṉku	2.709107211
7	839	aintu	1.791127621
8	624	āṟu	1.332137825
9	551	pattu	1.176294778
10	536	oṉṟai	1.144272234
11	410	āyiram	0.875282866
12	404	kōṭi	0.862473848

13	388	iraṇṭum	0.828316468
14	338	ēzu	0.721574655
15	304	nūṟu	0.648990222
16	303	eṭṭu	0.646855386
17	282	ilaṭcam	0.602023825
18	232	oṉpatu	0.495282012
19	215	oṉṟil	0.458989795
20	207	irupatu	0.441911105
21	203	iraṇṭaiyum	0.433371760
22	162	oṉṟē	0.345843474
23	153	oṉṟukku	0.326629947
24	145	muppatu	0.309551257
25	143	aimpatu	0.305281585
26	137	oṉṟiṉ	0.292472567
27	130	oṉṟutāṉ	0.277528714
28	128	nāṟpatu	0.273259041
29	105	mūṉṟum	0.224157807
30	105	oṉṟaik	0.224157807

Table-32

XY (Scatter) Chart-19

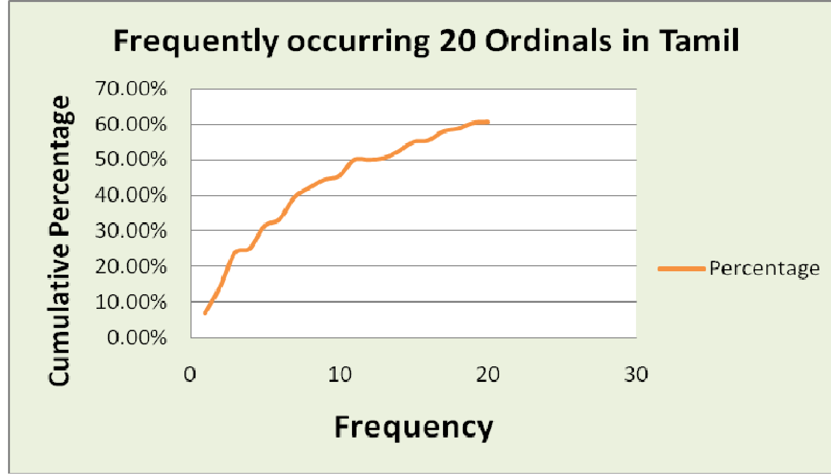

The cardinal *oru* is an adjectival form of *oṉṟu,* most frequent one with 27527 tokens in the CIIL-Tamil corpus occupying the first place with a coverage of 58.76%. Followed by *oru, iraṇṭu* occurring with 3665 tokens with coverage of 7.82%. The cardinal *oṉṟu* is in the third place occurring in 2661 tokens with a coverage of 5.68%. Apart from lexico-semantic properties indicating quantity number wordS differ morphologically from all other nominal parts of speech

in that they have secondary stems called ordinals as against cardinals the primary stems. Complex numerals are formed by the combinations of preceding tens, hundreds before unities and tens.

3. 9. 1 MOST FREQUENTLY OCCURRING 20 ORDINALS AND THEIR PERCENTAGE

Sl. No.	Frequency	Tamil Ordinals	% Coverage to the extracted total frequencies
1	4073	mutal	45.08523356
2	1770	mutalil	19.59264999
3	700	iraṇṭāvatu	7.748505645
4	617	iraṇṭām	6.829754262
5	366	mūṉṟāvatu	4.051361523
6	307	mūṉṟām	3.398273190
7	189	mutalām	2.092096524
8	156	mutalāvatu	1.726809830
9	130	nāṉkāvatu	1.439008191
10	121	nāṉkām	1.339384547
11	86	pattoṉpatām	0.951959265
12	86	aintāvatu	0.951959265
13	83	ēzām	0.918751384
14	72	āṟām	0.796989152
15	58	āṟāvatu	0.642019039
16	56	eṭṭām	0.619880452
17	46	ēzāvatu	0.509187514
18	43	eṭṭāvatu	0.475979632
19	38	pattāvatu	0.420633164
20	37	oṉpatām	0.409563870

Table-33

XY (Scatter) Chart-20

In Tamil, ordinal numbers are formed by the addition of the suffix *-ām* or *–āvatu*. Table-34 displays the most frequently occurring 20 ordinals words their frequency with percentage. The word *mutal*, which is the most frequent one among the cardinals occurring 4073 tokens with a coverage of 45.08%. The last ordinal is *o<u>n</u>patām*, which is least frequent. What we can also observe from the above ordinals is that nine ordinals ending *–āvatu* as in *iraṇṭāvatu, mū<u>n</u><u>r</u>āvatu, mutalāvatu, nā<u>n</u>kāvatu, aintāvatu, ā<u>r</u>āvatu, ēzāvatu, eṭṭāvatu, pattāvatu* and the other nine ordinals end in *–ām* as in *iraṇṭām, mū<u>n</u><u>r</u>ām, mutalām, nā<u>n</u>kām, patto<u>n</u>patām, ēzām, ā<u>r</u>ām, eṭṭām, o<u>n</u>patām.* If we compare both the cardinal and the ordinal numbers in tables, i.e. 33-34, we understand that ordinal words are less frequent than the cardinal words in the modern Tamil corpus. It is interesting to note that more or less the quantity of arithmetic value of the numbers correspond to the frequency lower arithmetic value of the number greater may be the frequency.

3. 10 POSTPOSITIONS

Prepositions are defined as "a part of speech usually indeclinable in form used together with noun phrase to show the relationship between that phrase and other words in the sentences" (Hartmann, R.B.K. et al. 1972). The postpositions are certain forms, which occur immediately after nouns and

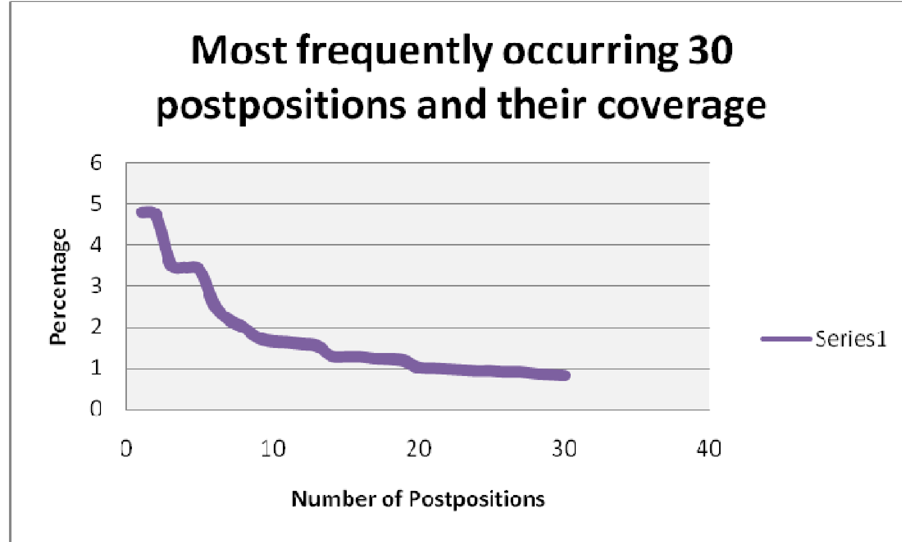

which establish some grammatical relations between the nouns which follow and the verb in the clause. These forms are termed postpositions only because they occur after nouns. In English, such forms occur before nouns and hence they are called prepositions. A postposition may be historically traceable to a noun or a verb. Since they have become grammaticalized forms, descriptively they have to be treated as a separate category of postposition. Tamil has a number of forms functioning as postpositions, which have been motioned in many grammatical works on Tamil (see, Schiffman, H.F. (1979), Asher, R. E. (1982), Thomas Lehmann (1989), Kothandaraman, P. (1997), Annamalai, E. (1999), Bhadriraju Krishnamurti (2003), Palanirajan, G. (2010)). Here, I have listed most frequently occurring postpositions and their percentage from the corpus that I have used for this study.

3. 10. 1 MOST FREQUENTLY OCCURRING 30 POSTPOSITIONS AND THEIR COVERAGE IN THE CORPUS

Sl. No.	Frequency	Postposition	% in the total Coverage
1	231	piṟaku	4.795516
2	227	pōṉṟa	4.712477
3	170	piṉ	3.529168

27	44	paṟṟi	0.913432
28	42	uḷḷa	0.871912
29	41	paṟṟi	0.851152
30	40	mūlam	0.830392

Table-34

XY (Scatter) Chart-21

A majority of the postpositions are spatio-temporal adverbs, locatives and similar others. Their distribtution is restricted by the kind of nominal complements they take. In the modern linguistic literature it is consider that postpositions assigns case to their complement nouns.

Table-35 displays a set of four postpositions viz. *koṇṭu*, *pōṉṟa*, *paṟṟi* and *paṟṟiya* that require nominal complement inflected for accusative that means they occur after accustative case marker. Another four postpositions require nominal complements inflected for dative, such as uḷḷa, *piṟaku*, *mēl and muṉ*.

Similarly two postpositions such as *mūlam* and *varai* require nominative complement. In the same manner, there are four postpositions such as *pōl, pōla, kūṭa, tavira koṇṭē, pōlavē, viṭa, nōkki, kuṟittu* and *cuṟṟi* are classified as accusative. The postposition *iruntu* is classified as locative occurring only once. The postpositions such as *piṉ, piṉṉar, veḷiyē* and *mēlē* are classified as dative postpositions. And finally *mītu* as oblique postposition. There are two locative postposition such as *iruntu* and *uḷḷē* and three postpositions are classified as dative such as *kīzē, kīz* and *muṉpu.* Thus, these frequently occurring postpositions have been distributed into different classification. The XY (Scatter) Chart-13 represents the table-35.

3. 11 DEMONSTRATIVES

According to Lehmann (1989), there are two determiners in Modern Tamil, they are often called demonstratives, which occur in pre-nominal position. They specify or identify referent of a noun phrase by describing the referent's proximity to the speaker. The proximate demonstrative determiner is *inta* 'this, these' and the remote demonstrative determiner is *anta* 'that, those'. For examples:

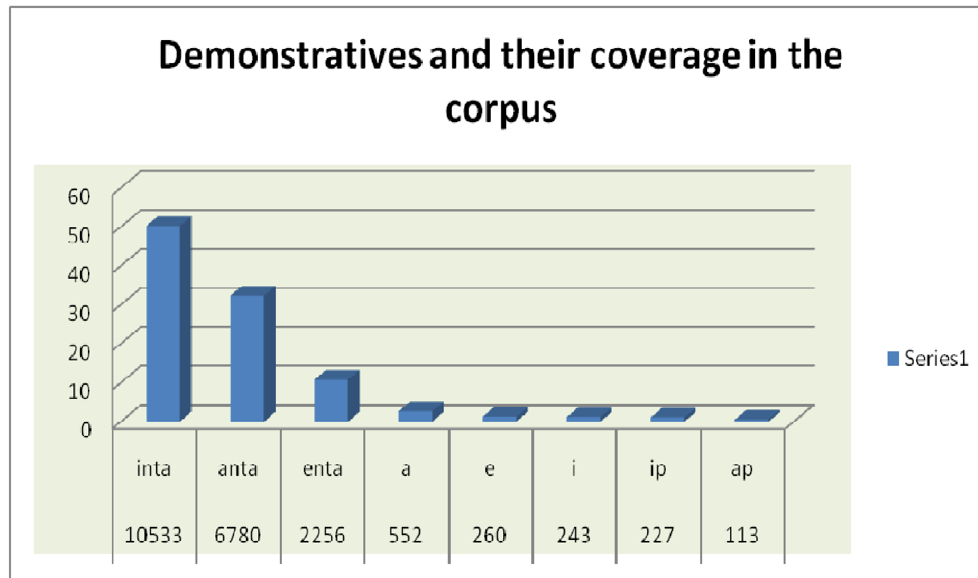

inta-p paḷḷi ‘this school’

antak kuzantaikaḷ ‘those children’

These demonstratives *anta, inta* and *enta* (wh-demonstrative) are frequently used instead as procliticized as *a, i* and *e* as well as *ap, ip* and *ep* in the corpus. These demonstrative bases are cliticized forms *a, i,* and *e* have the same semantic effect as their corresponding demonstrative bases *anta, inta* and *enta* demonstratives. Even though we have two basic opposition (proximal and distal), which is complemented by a deictically neutral form: *inta* 'this', *anta* 'that' and *enta* 'what/which'. Table-36 contains demonstratives and their frequency along with percentage in the corpus.

Sl. No.	Frequency	Determiners	% Coverage to the extracted total frequencies
1	10533	inta	50.24327418
2	6780	anta	32.34115627
3	2256	enta	10.76130509
4	552	a	2.633085289
5	260	e	1.240221332
6	243	i	1.159129937
7	227	ip	1.082808624
8	113	ap	0.539019271

Table-35

Column Chart-4

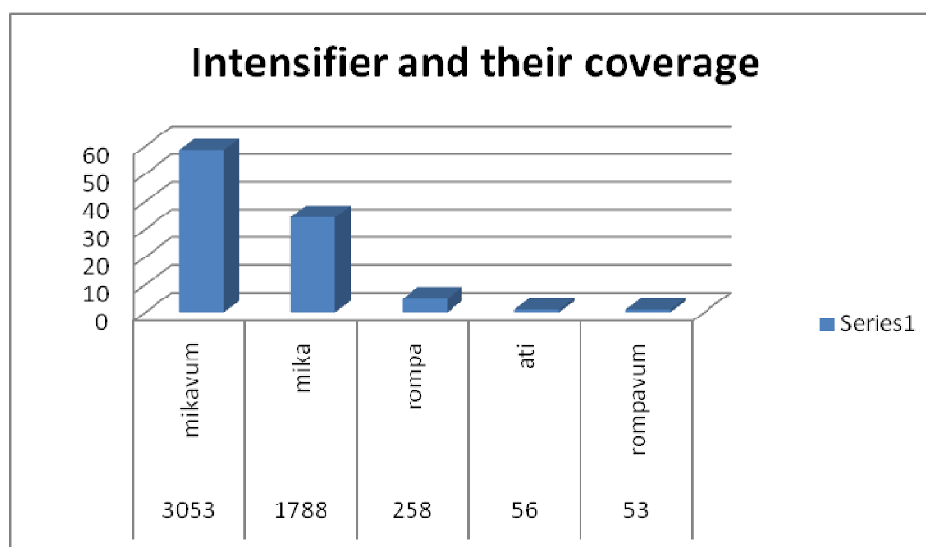

Out of the three, the proximal demonstrative *inta* 'this' is most frequent one than the other with 10533 tokens covering 50.24% of the corpus. Then the distal demonstrative *anta* 'that' is in second place with 6780 tokens with cumulative coverage of 32.34%. The third place is occupied by the wh-demonstrative *enta* 'what/which' with 2256 tokens, which is a complement of both *inta and anta*. The column chart-4 reveals the cumulative percentage according to their frequency in the corpus.

3. 12 INTENSIFIERS

Intensifiers are the words, which qualify both adjectives, adverbs; verbs and certain abstract nouns intensifiers. There are only a few such words, which come under this group (Kothandaraman, P. 1997). The following intensifiers have occurred with different frequencies in the corpus.

Sl. No.	Frequency	Intensifier	% Coverage to the extracted total frequencies
1	3053	mikavum	58.62135177
2	1788	mika	34.33179724
3	258	rompa	4.953917051
4	56	ati	1.075268817
5	53	rompavum	1.017665131

Table-36

Column chart-5

The intensifier *mikavum* is occurs with 3053 tokens followed by *mika* with 1788 tokens *mikavum* and *mika* have the same meaning. Even if we remove the –v-

um from *mikavum* it does not change its meaning. In the same manner, *rompa* (with 258 tokens) and *rompavum* (with 53 tokens) are share the same sense. Again *rompa* and *rompavum* have similar semantics. The word, *ati* occurs with 56 tokens.

3. 13 N-GRAM

A simple model of written text is a series of symbols that carry some meaning when considered as a whole. We may wish to treat these symbols as phrases, words, syllables and characters depending on the level of analysis. N-grams are a simple representation that suits this view of written language. An n-gram is a sequence of *n* units, or *tokens*, of text where these units are typically of one or more single character length strings that are delimited by spaces. However, some times a token could also be a fixed length character sequence, strings with embedded spaces, etc. depending on the intended application.

Study of n-grams is an interesting task in some way or other it has become the fundamental task in natural language processing. An n-gram might be considered interesting if it occurs more often than would be expected by chance, or has some tendency to predict the occurrence of other phenomena in text. There is a long history of research in this area. Shannon (1951) to estimate the per-letter entropy of the English language used *n*-grams of characters. After 60s there has been a large amount of work in developing corpus-based techniques to identify collocations in text (e.g., Church, K. and Hanks, P (1990), Dunning, T. (1993), Pedersen, T. (1996) etc.

In this chapter we obtain the n-gram (bigram of two characters or word sequences, trigram of three characters or word sequences, four gram of four characters or word sequences and so on and their frequency and probabilities from large amount of text corpora.

3. 13. 1 COUNTING NGRAMS

In any study of *n*-grams, frequency values of various combinations of tokens are computed. When a given n-gram represents its leftmost token as w_0, the next token as w_1, and so on until w_{n-1}. Further let *f(a, b,…., c)* be the number of n-grams that have token w_a in position *a*, token w_b in position *b*, … and token w_c in position *c*, where 0 < = *a* < *b* < … < *c* < n. Then, given an n-gram, the first frequency value reported is *f* (0, 1,…, *n* -1); this is the frequency of the n-gram itself. This is followed by *n* frequency values, *f*(1), …, *f*(n-1); these are the frequencies of the individual tokens in their specific positions in the given n-gram.

This is followed by (n choose 2) values,

f(0, 1), *f*(0,2), …, f(0, n – 1),

f(1,2), … f(1, n-1), … f(n-2, n-1).

This is followed by (n choose 3) values,

f(0, 1,2), f(0,1,3), …, f(0, 1, n-1),

f(0,2,3), …, f(0, 2,n-1), …f(0n-2, n-1),

f(1,2,3), f(n-3, n-2, n-1).

And so on, unit l (n choose n-1), that is n, frequency value

f(0,1, …, n-2),

f(0,1, …, n -3, n-1),

f(0,1, …, n-4, n-2, n-1), …,

f(1,2, …, n-1).

This gives us a total of 2^{n-1} possible frequency values for n-grams of size *n*. We call each such frequency value a *frequency combination*, since it expresses the number of n-grams that have a given combination of one or more tokens in one or more specific positions. By default, all such combinations are displayed, exactly in the order shown above. However, the total number of frequency values grows exponentially with the value of *n* that is the n-gram size under consideration. Since computing, sorting and later displaying such a

large number of frequency values can be both very resource intensive as well as necessary.

3. 14 SEQUENCES OF TWO CHARACTERS FROM THE CORPUS

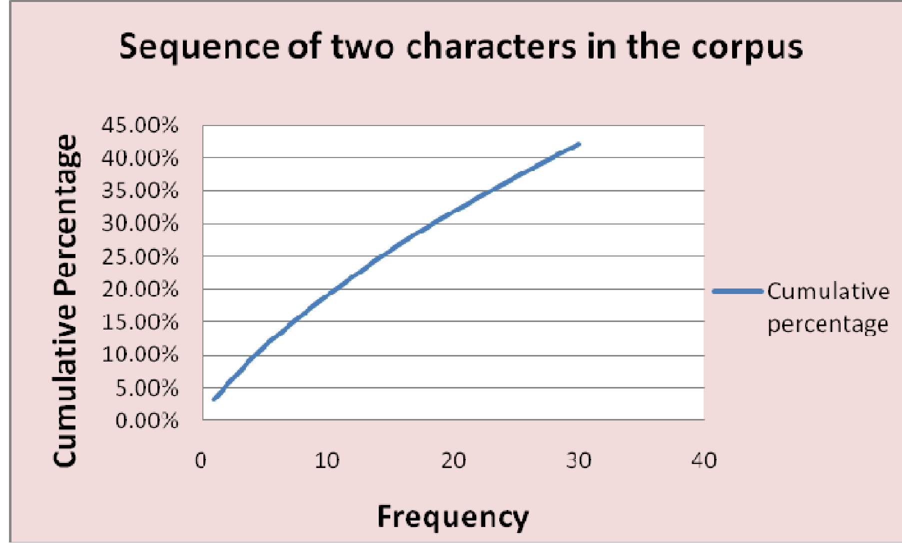

In the following study frequencies of two character sequences are extracted from the corpus to get glimpse of how it reflects the distribution viz-a-viz the morpheme and word sequences though n-gram study of characters through, in no way it is relevant to our statistical study of Tamil morphology directly.

Most frequently occurring 30 sequences of two characters and their percentage from corpus as follows.

Sl. No.	Frequency	Sequence of two characters	% Coverage to the extracted total frequencies
1	3596280	ka	7.721244746
2	2331727	ar	5.006238349

30	1060656	av	2.277237748

Table-37

XY (Scatter) Chart-22

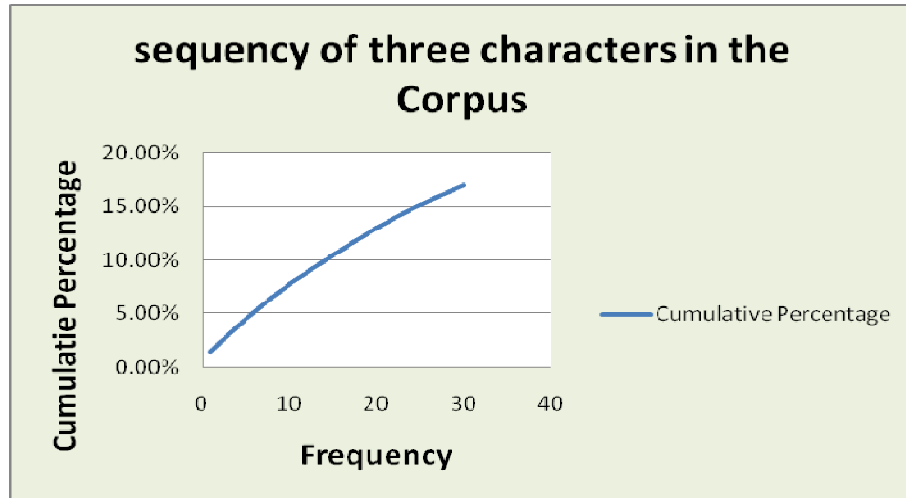

Table-37 displays the most frequently occurring 30 sequences of two characters sequences i.e. bigrams from the Tamil corpora. For the frequency study of sequence of characters, we have used Tamil CIIL, EMILLE and BIBLE Corpora. A statistical study of characters, syllables and words on CIIL corpus have been explored (not on bigram, trigram etc.) in my M.Phil. research (see Thenarasu, S. 2006) and to be different from that previous work we have considered much larger corpora for this study. Among sequences of two characters *ka,* is the most frequent sequence with 3596280 tokens and has a coverage of 7.72% in the corpora. They are a combination of stop velar and a short low unrounded vowel. The second place is by *ar,* occurring with 2331727 tokens with 5.00% coverage. In the same manner if we take first 10 words from the above table, six bigrams are CV types as *ka, ta, tu, va, pa, ti* and two bigrams are VC types such as *ar, at* and another two are CC types i.e. geminated *kk* and *tt*. When we look at table-38 as whole, one can understand that out of 30 bigrams characters, twelve are CV types such as *ka, ta, tu, va, pa, ti, ṭa, ku, ṭu, ya, ru,* and *ra*. Then thirteen are VC types such as *ar, at, aṭ, il, aḷ,*

am, um, iy, aṉ, uk, ir, al and *av*. Followed by that five CC types such as *kk, tt, nt, ṭṭ and pp*, out of which four are germinated sequences. From the results, what we see is that CV types are more frequent and have higher coverage than VC and CC types in the corpora.

3. 14. 1 MOST FREQUENTLY OCCURRING 30 SEQUENCES OF THREE CHARACTERS AND THEIR PERCENTAGE

Sl. No.	Frequency	Sequence of three character	% Coverage to the extracted total frequencies
1	1341059	kaḷ	8.435922364
2	780027	atu	4.906754448

24	392420	ikk	2.468515296
25	374885	ṅka	2.358211500
26	359673	yil	2.262520519
27	351091	aṉa	2.208535507
28	336396	akk	2.116096711
29	334123	utt	2.101798421
30	328806	aṭa	2.068351869

Table-38

XY (Scatter) Chart-23

A majority of these sequence in advertantly turnout to be identical to formative or functional words in Tamil as in *kaḷ* plural, *atu* the pronominal eding *ku, ukku* the dative suffix variants, *iya* the adjectival suffix, *ppa, kka* infinitive, *iru* auxiliary etc.

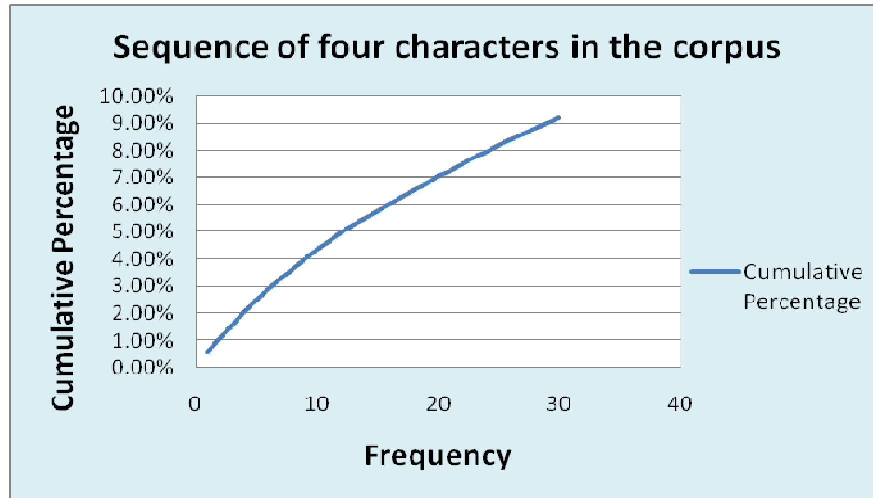

Table-39 reveals that *kaḷ* which is CVC type sequence of three characters is most frequent one occurring in 1341059 tokens with 8.43% coverage occupying the first place and *aṭa,* which is VCV type of sequence of characters is less frequent one occurring in 328806 tokens with 2.06% coverage in the corpora. Similarly, if we observe table-39, we can see that there are CVC type sequences *kaḷ, var, paṭ, yil,* and *ant,* then, the VCV type sequences *atu, iya, iru, ava, āka, ara, aṉa, aṭa* and *the* CCV types are eight such as *kku, nta, ppa, kka, tti, ṭṭa, rka, ṅka;* VCC type sequences *att, ukk, app, aṭṭ, aṅk, ikk, akk, utt* and finally CCC type *ttw* has occurred in the bigram list. In the sequence of three characters, there are five types of syllables such as *CVC, VCV, CCV, VCC* and *CCC.* Out of these five types, VCV, CCV and VCC are common and equally distributed.

3. 14. 2 MOST FREQUENTLY OCCURRING 30 SEQUENCES OF FOUR CHARACTER/FOUR-GRAM IN THE CORPUS

Yet this is another n-gram study where sequence of morphological elements and their frequency of usage is focused.

Sl. No.	Frequency	sequence of four characters	% Coverage to the extracted total frequencies
1	425249	rkaḷ	6.032683675
2	385095	ppaṭ	5.463049460
3	368718	atti	5.230721434
4	362009	ukku	5.135545961
5	351774	appa	4.990349811

11	253310	aṭṭa	3.593516038
12	248283	uḷḷa	3.522201818
13	216780	anta	3.075292751
14	202000	rukk	2.865620148
15	200589	kaḷai	2.845603366
16	196896	ikaḷ	2.793213587
17	196650	ttil	2.789723773
18	194631	aiyil	2.761081757
19	190434	kaḷu	2.701542115
20	190180	eṉṟu	2.697938810
21	185647	kaḷi	2.633632592
22	182149	runt	2.584009130
23	176293	irun	2.500934518
24	169734	paṭu	2.407886981
25	167166	ṭatt	2.371456721
26	166879	inta	2.367385271
27	163230	varu	2.315619687
28	158443	kiṟa	2.247710164
29	152688	akka	2.166068362
30	149313	kkum	2.118189808

Table-39

XY (Scatter) Chart-24

As we move from bigrams to trigrams and tetragrams the sort of sequences that we encounter are more or less tent to be forms identical to morpholigcal formatives and roots or shorter words. Ex. –ukku, appa, avar(3p.h.) paṭṭ (passive), ṅkaḷ (plural), uḷḷa(adjectival participle), anta (demonstrative), kaḷai(pluaral accu.) and etc.

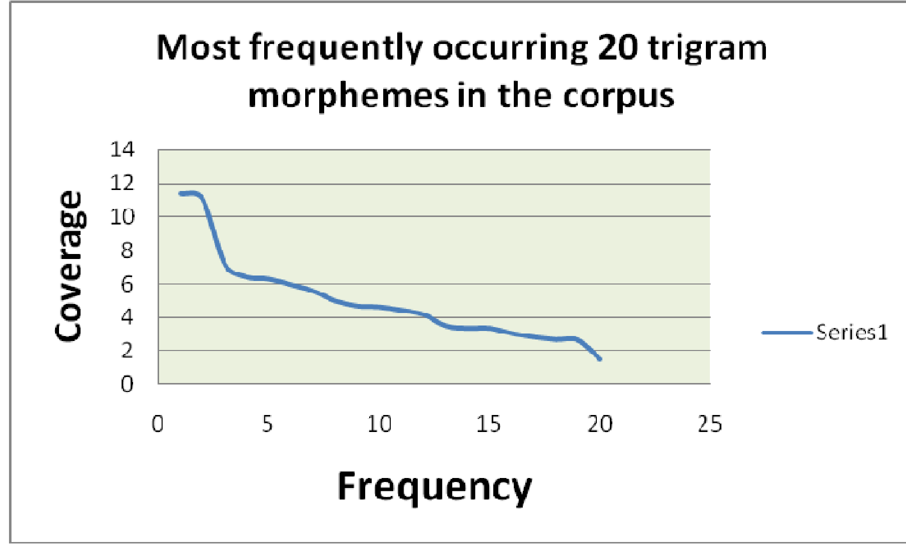

If we observe the sequence of four characters and their frequency in table-40, *rkaḷ* stood in the first place occurring with 425249 tokens with 6.03% and *kkum* stood with lowest frequency occurring in 149313 tokens with 2.11% in the list. There are five CCVC types such as *rkaḷ, ppaṭ, ṅkaḷ, ttil, kkum, ten* VCCV types such as *atti, ukku, appa, aṅka, aṭṭa, uḷḷa, anta, eṉṉu, inta, akka,* there are three VCVC types such as *avar, ikaḷ, irun* and seven CVCV types such as *kiṟa, paṭu, kaḷi, aiyil, varu, kaḷu, kaḷai*. There are also four CVCC types such as *paṭṭ, rukk, runt, ṭatt,* and finally, there is one VCCV type as *arka*. What we observe from the sequence of characters is that in bigram level, there are three types of syllables VC, CV and CC, in the trigram level, there are five types of syllables CVC, VCV, CCV, VCC and CCC. At four-gram level, there are five types of syllables CCVC, VCCV, VCVC, CVCV and CVCC. These different types of occurrences in the corpus reveals that it would be useful when we develop course material for the purpose of Language Teaching and Testing so one need to give priority for VC types first then CV and CC types etc.

Thus, the sequences of characters in the corpora can throw a picture about the distribution of the language in terms of correspondences between character sequences as they grow they tend to be similar to morphological formatives. And morphological formatives and their distribution influence the frequency of coverave of character sequences in the corpus.

3. 14. 3 MOST FREQUETNLY OCCURRING SEQUENCES OF THREE MORPHEMES

Sl. No.	Frequency	sequence of three morphemes	% Coverage to the extracted total frequencies
1	404	kkiṟ-ār-kaḷ	11.37067267
2	393	pp-ār-kaḷ	11.06107515
3	256	kiṟ-ār-kaḷ	7.205178722
4	228	nt-ār-kaḷ	6.417112299
5	224	ṇṭ-ār-kaḷ	6.304531382
6	212	p-ār-kaḷ	5.966788629
7	199	v-ār-kaḷ	5.600900647
8	178	ṅkaḷ-il-um	5.009850830
9	167	kaḷ-il-um	4.700253307
10	165	t-ār-kaḷ	4.643962848
11	158	tt-il-um	4.446946243
12	149	ṉ-ār-kaḷ	4.193639178
13	125	yil-ē-yē	3.518153673
14	120	kaḷ-ukku-t	3.377427526
15	120	kaḷ-ai-yum	3.377427526
16	109	tt-il-ē-yē	3.067830003
17	101	kaḷ-ai-t	2.842668168
18	96	kaḷ-ukku-m	2.701942021
19	95	kaḷ-ai-p	2.673796791
20	54	tt-il-iruntu	1.519842387

Table-40

XY (Scatter) Chart-25

Table-40 displays the most frequently occurring sequences of three morphemes in the corpus. If we look at first 10 trigram, eight of them such as *kkiṟ-ār-kaḷ, pp-ār-kaḷ, kiṟ-ār-kaḷ, nt-ār-kaḷ, ṇṭ-ār-kaḷ, p-ār-kaḷ, v-ār-kaḷ* and *t-ār-kaḷ* are part of verbal inflection and two of them such as *ṅkaḷ-il-um* and *kaḷ-il-um* are from nominal inflection. Among the verbal inflectional morphemes, two *kkiṟ-ār-kaḷ and kiṟ-ār-kaḷ* are present tense markers. The three sequences *pp-ār-kaḷ, p-ār-kaḷ, v-ār-kaḷ* are future tense morphemes and the three sequences *nt-ār-kaḷ, ṇṭ-ār-kaḷ, t-ār-kaḷ* are past tense morphemes.

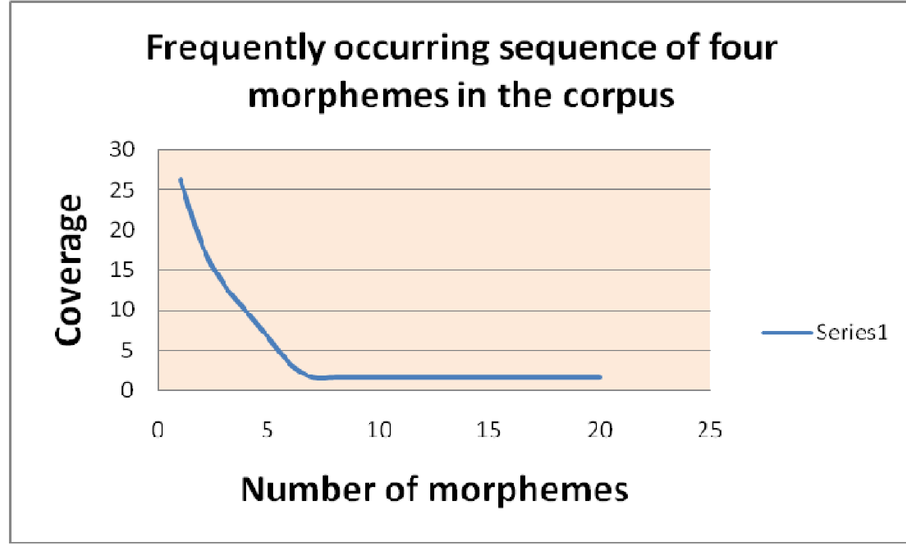

Similarly, if we look at next ten words i.e. from 11-20, nine of them are from nominal suffiexes such as *tt-il-um, yil-ē-yē, kaḷ-ukku-t, kaḷ-ai-yum, tt-il-ē-yē, kaḷ-ai-t, kaḷ-ukku-m, kaḷ-ai-p, tt-il-iruntu* and one is from verbal inflection i.e. *ṉ-ār-kaḷ,* the past tense marker. Out of these nine nominal morphemes, four *tt-il-um, yil-ē-yē, tt-il-ē-yē* and *tt-il-iruntu* inflected for locative case marker, two *kaḷ-ukku-t* and *kaḷ-ukku-m* inflected for dative case marker and three *kaḷ-ai-yum, kaḷ-ai-t, kaḷ-ai-p* inflected for accusative case marker. When we compare the first 10 trigrams with the second 10 trigrams, one would see that in the first 10 trigrams verbs are frequent and the secound 10 trigrams nouns are common. This indicates in Tamil the verbal inflection are more complex and frequent in

their distribution. The following are the sequences of quadri morpheme sequences by their frequences.

3. 15 MOST FREQUENTLY OCCURRING SEQUENCES OF FOUR MORPHEME

Sl.No.	Frequency	sequence of four morphemes	% Coverage to the extracted total frequencies
1	16	tt-iṉ-āl-tāṉ	26.22950820

Table-41

XY (Scatter) Chart-26

The table-41 contains sequences of four morphemes that occurred in the corpus. What one can simply observe from the sequence of four morphemes is that they are not frequent but are rare occurrences of the corpus. Though a noun in Tamil can take a number of inflectional endings like *-kaḷ-ukku-maṭṭum-ē-tāṉ-ā-ṭi* but in the real data of present corpus, it does not occur like that. Even the simple sequences of four morphemes are rare. It seems that the habit of writing in the modern Tamil has been changed. For example, consider this word *vantukoṇṭirukkiṟēṉ* 'I am coming' been written with spaces as *vantu koṇṭirukkiṟēṉ* occurring 51 tokens in the corpus but not a single occurrence of this word i.e. this word *vantukoṇṭirukkiṟēṉ* in the present corpus.

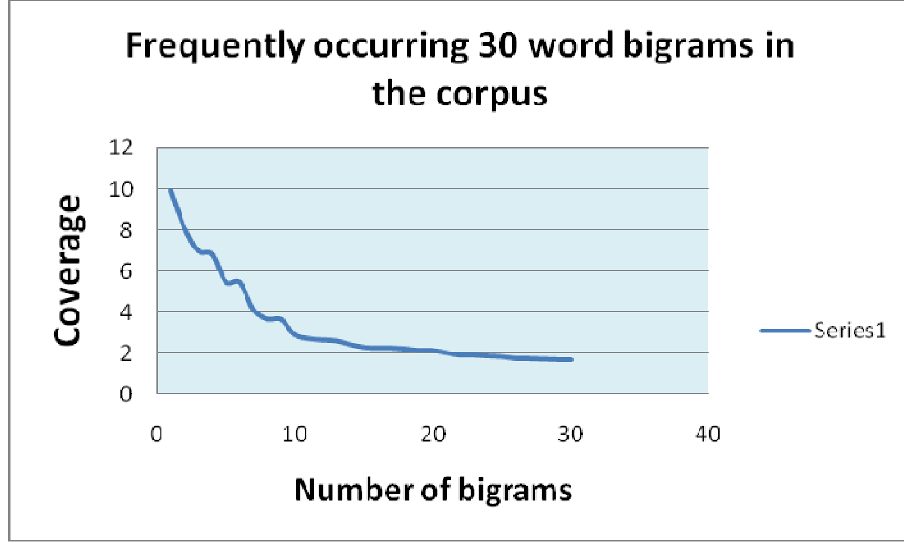

Among the sequence of four morphemes, the sequence *tt-iṉ-āl-tāṉ* is more frequent with the noun root *kāraṇam* compare with other sequence of morphemes. If we consider the entire table-42, two *tt-iṉ-āl-tāṉ* and *kaḷ-āl-maṭṭum-ē* have instrumental case marker, six *ṅkaḷ-ukk-āka-vum, tt-iṟk-āka-t-tāṉ, kaḷ-ukku-miṭai-yē, kaḷ-ukk-uḷḷ-ē, kaḷ-ukku-t-tāṉ, kaḷ-ukk-āka-vē-tāṉ* have dative case marker. The next seven of them such as kaḷ-*uṭaṉ-ē-yē, kaḷ-ōṭ-ē-yē, kaḷ-uṭaṉ-ē-vā, ṅkaḷ-uṭaṉ-ē-yum, kaḷ-uṭaṉ-ē-yē, kkaḷ-uṭaṉ-ē-yē, kaḷ-uṭaṉ-ē-tāṉ* have sociative case marker. Similarly five of them *kaḷ-il-ē-yē, kaḷ-il-iruntu-ē, kaḷ-iṭam-um-kūṭa* have locative case markers and finally the two have *kaḷ-ai-yē-tāṉ and kaḷ-ai-yē-tāṉ*

accusative case marker. Sequence of two, three and four (i.e. bigram, trigram, four-grams) formatives common among nominal rather than verbal inflections.

Table-42

XY (Scatter) Chart-27

A glimps the words in table-42 provides most frequently occurring 30 bigrams of words in the corpus. The first pair of words *koḷḷa vēṇṭum* with 1327 tokens occupy the first place. If we look at first 10 bigrams of words, three word pairs such as *koḷḷa vēṇṭum, irukka vēṇṭum, ceyya ēṇṭum* are combinations of verb infinitive and the auxiliary verb vēṇṭum. The two pairs such as *vēṇṭum eṉṟu, vēṇṭum eṉṟa* are combinations of verb and quotative marker.The two pairs of words such as (1950) *ām āṇṭu*, (1970) *ām āṇṭil* are combination of noun and ordinal suffix *-ām*. The two pairs of words such as *oru kuṟippiṭṭa*, *oru nāḷ* are combinations of ajdectival form of *oru* and a noun. The other pair such as *eṉṟu peyar* is combination of quotative with a noun is common.

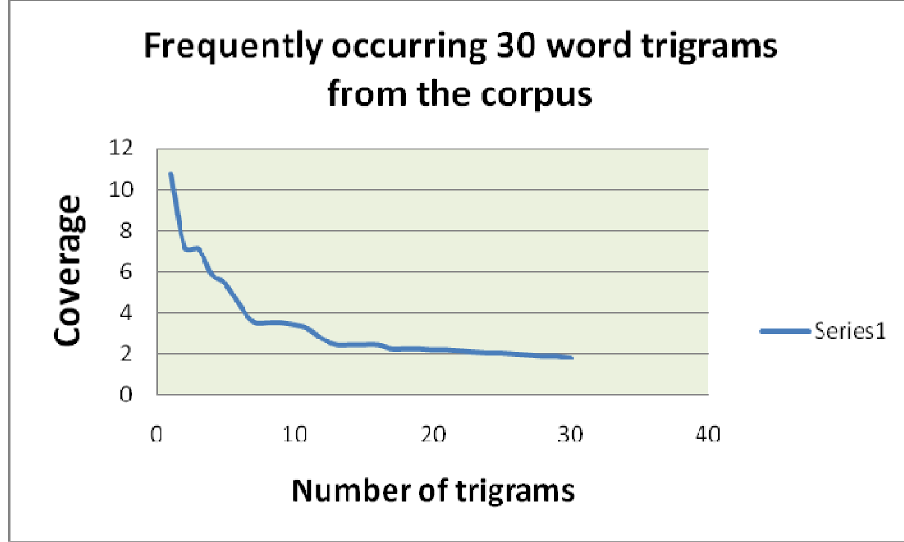

In the same manner, if we look at the entire table-43, seven pair of words such as *koṇṭu vantu, vaikka vēṇṭum, vaittuk koṇṭu, viṭa vēṇṭum, koḷḷa vēṇṭum, irukka vēṇṭum, ceyya vēṇṭum* are main verb+ auxiliary combinations, and ten pair of words such as *itu oru, oru uṟai, oru periya, oru cila, eṉṟu oru, enta oru, eṉpatu oru, oru ciṟu, oru kuṟippiṭṭa, oru nāḷ* are combination of ajdectival form *oru*, with different categories such as adjective, noun, pronoun, quantifier, quotative, wh-demonstrative and relative participle. The three pairs of words such as *cila camayaṅkaḷil, cila camayam* and *atika aḷavil* are combination of quoantifier and a noun. These three pairs of words such as

pēravait talaivar, māṇpumiku pēravait, maṇi nēram are combination of adjective and noun and noun plus noun type.

28	40	koḷḷa	vēṇṭum	eṉṟu	1.927710843
29	40	iccaṭṭattil	kuṟikkappaṭṭuḷḷa	kuṟaivāṉa	1.927710843
30	38	allatu	iccaṭṭattil	kuṟikkappaṭṭuḷḷa	1.831325301

Table-44

XY (Scatter) Chart-28

Table-43 displays the most frequently occurring 30 sequences of three words in the corpus. The *māṇpumiku pēravait talaivar* occupied the first place with 224 tokens which is a combinations of adjective with compound word and *allatu iccaṭṭattil kuṟikkappaṭṭuḷḷa* are sequences of words which occupied the last place in the table occurring with 40 tokens that invlolves combination of particle, noun and a verb. Similarly, if we look at the the entire table, these five pairs of words *vaittuk koḷḷa vēṇṭum, eṭuttuk koḷḷa vēṇṭum, ceytu koḷḷa vēṇṭum, terintu koḷḷa vēṇṭum, pārttuk koḷḷa vēṇṭum* are verb cominations involving main verb + auxiliary verb + auxiliary verb. The next four sequences *ceyya vēṇṭum eṉṟu, eṉṉa ceyya vēṇṭum, koḷḷa vēṇṭum piṟaku, koḷḷa vēṇṭum eṉṟu* are the combination of quotative, wh-words, adverb with verb. The sequences of words *pēravait talaivar avarkaḷē* is the combination of compound noun with honorific form. Another sequence *mūlam iṉapperukkam ceyyappaṭukiṟatu, vitai mūlam iṉapperukkam* are unique and no one would have thought this combinations exist in the frequency list. The sequence

of words *iccaṭṭattiṉ m pirivil* are the combinations of noun and numeral suffix with noun. Another sequence of words *iraṇṭu allatu mūṉṟu* are the combination of numeral words with particle. The n-grams like *pēravai naṭavaṭikkaikaḷ ceyalaka*, *naṭavaṭikkaikaḷ ceyalaka veḷiyīṭu*, *caṭṭamaṉṟap pēravai naṭavaṭikkaikaḷ* are a combination of nouns. Finally the sequences *kipi ām nūṟṟāṇṭil, kipi ām āṇṭu* involve abbrevation (B.C.) noun and numeral suffix with noun. This trigram *n tēti piṟantavar* are the combination of numeral suffix and noun with verb. This pair of words *mātam n tēti, mātam ām tēti, ām āṇṭu mutal* are the combiations of numeral suffix and noun and one is with postposition 'from'. This sequences of words *oru maṇi nēram* is the combination of adjectival form with noun.

3. 17 COLLOCATION

Lexicographers and Linguists have long been interested in collocations. A collocation an accepted usage where the whole is perceived to have an existence beyond the sum of the parts. Collocations include compounds (*pēravait talaivar*), phrasal verbs (*pārttuk koḷḷa vēṇṭum*), and other stock phrases (*iraṇṭu allatu mūṉṟu*). They often have a specialized meaning or idiomatic, but they need not be. This expression may be a simply combination of any categories. But, the frequent use of this phrase as a fixed expression accompanied by certain connotations justifies regarding it as a collocation. Indeed, any expression that people repeat because they have heard others using it is a candidate for a collocation.

The term "collocation" has popularized by J. R. Firth in his 1951 paper *Modes of meaning*: *One of the meanings of* ass *is its habitual collocation with an immediately preceding* you silly... He emphasizes that collocation is not a simple co-occurrence but is "habitual" or "usual". The notion of collocation may be confusing to readers without a background in linguistics (look at the above tables of bigram and trigram words). We see what a collocation is. There are

actually different definitions of the notion of collocation. Some authors in the computational and statistical literature define a collocation as two or more *consecutive* words with a special behavior, Choueka (1988), for example:

A collocation is defined as a sequence of two or more consecutive words, that has characteristics of a syntactic and semantic unit, and whose exact and unambiguous meaning or connotation cannot be derived directly from the meaning or connotation of its components. Most of the examples we have presented in this chapter also assumed adjacency of words. But in most linguistically oriented research, a phrase can be a collocation even if it is not consecutive (as in the example *ivvāṟu avar*). The following criteria are typical of linguistic treatments of collocations (see for more Benson (1989) and Brundage et al. (1992)), noncompositionality being the main one we have relied on here.

According to Hunston (2010), the collocation is to improve the decisions made by dictionary writers and syllabus designers when systematically presenting any language vocabulary to users or linguists especially in applied linguistics. Depending on the theoretical approach adopeted, collocation is a semantic, textual, or statistical property (Partington 1998) which involves words being used together more frequently than might otherwise be expcted, or being used togher very rarely. In the research literature which is relevant to collocation there is little agreement as to exactly how and why this 'togetherness' is motivated or restricted. This is principally because much of this literature has been produced as a result of work in other areas such as lexicography and dictionary design (Sinclair 1991; Moon 2007), English language teaching (Nattinger and DeCarrico 1992; Lewis 2000), and language acquisition (Pawley and Syder 1983; Wray 2002).

Collocations are important for a number of applications: natural language generation (to make sure that the output sounds natural and mistakes like *powerful tea* or *to take a decision* are avoided), computational lexicography (to automatically identify the important collocation to be listed

in a dictionary entry), parsing (so that preference can be given to parses with natural collocations), and corpus linguistic research (for instance, the study of social phenomena like the reinforcement of cultural stereotypes through language (Stubbs 1996)).

The way one can identify collocations is by looking at the frequency of words in the environment of the node word. If a potential candidate for a collocation, sometokens called a collocate, has a particularly high frequency in the environment, we can assume that the two words form a collocation. This involves comparing the frequency of a word in the node's environment with a benchmark frequency. The benchmark can either be a general word frequency list, or none is available, we can simply take the frequency of the word in the corpus we are investigating. However, in that case the frequencies are not independent of each other, which might skew the results.

3. 18 CONCLUSIONS

The study of morphology is of interest in a number of ways in NLP applications, both present and future, and because of its theoretical interest. We have seen that the words of a language are not simply a fixed set of strings chosen from a language's inventory of letters, or phonemes; the vocabulary is in fact built out of a set of morphemes in ways that are potentially quite complex, and in ways that may give rise to complex modifications of one or more morphemes in a word, each modification of each morpheme potentially sensitive to the choices of each of the other morphemes and also the order in the word. While the number of distinct words in a language does not grow as rapidly with length as the number of sentences in a language does, it is nonetheless true that the size of the total lexicon of a language is vastly larger than the size of the set of morphemes used to generate those words. In order to ensure that a system handles the entire lexicon, it is both practically and theoretically necessary to generate the lexicon computationally in a way that reflects the true structure of the

morphology of the language and their affixes. In addition, the meaning and function of a word is in many respects decomposable into the meaning and function of its inflectional stem and inflectional affixes, and so morphological analysis is an important step in statistical methods, at least in language with rich morphology like Tamil. At the same time, the formal structure of the morphological grammar of a language may be quite a bit simpler than the syntactic grammar, and allow for greater success at this point in the task of inferring the morphology from data. Advances in this area will shed light on the more general problem of induction of regular languages, which in turn may be helpful in the goal of induction of more comprehensive word grammars from natural language corpora.

CHAPTER-4

USE OF MORPHOLOGICAL STUDY IN NLP APPLICATIONS

4. 0 INTRODUCTION

The results of a morphological study are essential from the point of almost all practical applications that deal with natural language. After all, an application must first recognize the word in question before analyzing it syntactically, semantically, or whatever the level may be (Anton 2001). In this chapter, we describe the importance of the statistical study of morphology and how it can be used in various Natural Language Processing applications for Tamil. The morphological strength of Languages demands the use of thorough morphological analysis. Morphological analysis should be the first step towards any language processing task. We discuss here how this morphological analysis of the language assists in building and testing of NLP applications and enhancing their coverage. The results of the statistical analysis of Tamil morphology would be useful for enhancing the NLP applications such as WSD, Morphological Analyzer, Generator, POS tagger, Spell Checker, Finite State Automaton and MT etc.

The process of segmenting words into morphemes involves the study of word formation. The Tamil language is morphologically rich and agglutinative too. Each root word is affixed with several morphemes to generate word forms. Tamil involves rightward inflection to the root word. Computationally each root word can take hundreds of suffixes and generate a great number of inflected word forms, out of which only few thousands or hundreds exist in any typical corpus. For the purpose of analysis of such inflectionally rich language, the root and the morphemes of each word have to be studied from the point of its distributional aspects.

4. 1 MORPHOLOGICAL ANALYSIS OF TAMIL

The morphological structure of Tamil is quite unique and complex since it inflects for person, gender, and number markings and also combines with auxiliaries that indicate aspect, mood, causation, attitude etc., in case of verb and number, case, postpositions in case of nouns. For the purpose of analysis of such inflectional formations, the root and the morphemes of each word have to be identified based on corpus. The structure of verbal complex is unique and understanding of this will be a great helpful for any researcher as well as for a machine. The formation of the verbal complex involves arrangement of the verbal units and the interpretation of their combinatory meanings. Phonology also plays its part in the formation of verbal complex in terms of morphophonemic or sandhi rules which account for the shape changes due to inflection and classification of Tamil verbs is based on tense inflections. The inflection includes finite and non-finite and the later involves infinitive, adjectival, adverbial and conditional forms of verbs. Compared to verbal morphological analysis, noun morphological analysis is less challenging. Nouns occur with plural inflection, oblique formation, case, postpositions and clitics. (Rajendran et al. 2001).

Natural Language Processing is one of the most rapid developing areas nowadays. For a majority of languages, pools of raw texts or even simple wordlists are the resources most urgently needed. Statistical studies of corpus data are, for many applications, the raw fuel of NLP, and the testbed on which an NLP application is evaluated. It is the main requirement for almost every kind of natural language processing, such as machine translation etc. So, since 1960, when one of the first instances of a text corpus was created (Brown corpus), many such corpora were designed, together with the methods that were used in their production. In the last decade, new approaches in designing textual corpora have been developed of which crawlers of the text from the web. The later comes near the idea of having a

heterogeneous and informal language of communication. And this also serves another purpose - it democratizes the way the linguists work.

Corpus-based statistical studies to language have introduced new dimensions to linguistic description and to various applications by permitting some degree of automatic analysis of text. The most basic format used in displaying information about the linguistics elements in a corpus is generated by means of listing and counting.

One of the most explored fields of NLP is morphology. It is important because language is productive. In any given, one would encounter text that has a number of words and word forms that we haven't seen before and that are not in any precompiled dictionary. The core task of computational morphology is to take word as input and produce a morphological analysis for it. Morphotactics defines concatenation of the principal morphemes of a word, and it is typically described through finite state automata. But there are situations where the word formation process is not just joining of morphemes, besides other processes like reduplications, incorporation etc. These will be situations where the phonological rules are called for ensuring well-formedness. Phonological rules may apply and change the shape of morphs. Many linguists have modeled phonological rules, but it is considered that the most successful one is the model called two-level morphology (Koskenniemi, 1983). The two-level morphology model has been proved successful for formalizing the morphology of very different languages (English, German, French, etc.). This system is used even for conversion between different writing systems, it seems too.

Natural languages consist of a very large number of words that are built upon basic building blocks known as morphemes, the smallest linguistic units to possess meaning. In natural language processing, Morphology concerns with the discovery and analysis of the internal structure of words using computers. The result of the statistical study of morphology is relevant

in the selection and application in Word Sense Disambiguation, Morphological Analyzer, Morphological Generator, Parts-Of-Speech, Machine Translation, Spell-checker, Finite State Automaton etc.

Users of natural languages need no persuasion that words are naturally occurring units. We may have a doubt as to whether expressions like the *māṭṭu vaṇṭi* in Tamil and *bull-cart* in English should be treated as one word or two, but there is no disagreement about the notion that sentences can be analytically broken down into component words. Linguists and others who think deeply about such questions as "what is a word?" There are some difficult intermediate cases which linguists call clitics, particles, morphemes whose status as a full-fledged word is dubious. In all languages, or virtually all, it is appropriate to analytically break words down into component pieces, called morphs, and then to bundle morphs back into the functional units we call morphemes. Such an analysis is part of the functionality of a morphology, and is the central subject of this chapter (when a morpheme corresponds to only a single morph, as is often the case, we generally ignore the difference between a morph and a morpheme). In addition, an exhaustive description of Tamil morphology would bge necessary to identify an appropriate set of morphosyntactic features of a word; to the extent that the word's morphological decomposition can serve as a basis of specifying those features. Thus in this work, words are in terms of affixes, and the affixes should be labeled as indicating prefix + root + suffixes; plurality, case marker, clitics for nouns and tense, aspects, mood number, gender for verbs.

Implementing sophisticated computational accounts of natural language morphology goes back more than forty years. There have been several excellent book-length studies of computational morphology in recent years, with considerable concern for actual, real-world implementation, notably by Beesley & Karttunen (2003), Uma Maheshwar Rao (2006) and Roark & Sproat (2007), the grammar of words by Geert Booij (2007), as well as Ritchie et al. (1992) and Sproat (1992). Current work in this area focuses to a

very large extent on natural language processing and the use of finite-state transducers as a means to carry out the functions of morphology. This work was stimulated by the work of Douglas Johnson (1972), Ronald Kaplan and Martin Kay (1981), Kimmo Koskeniemmi (1983) and Lauri Karttunen and colleagues (1993). A well studied morphology of a language can be vital for many practical applications such as WSD, MA, MG, POS, MT, FSA, Spell-checker etc. A very humble but honest function of many products was appreciated by a wide range of end-users, and in a language with a rich inflectional morphology, as we know in languages such as Telugu, Tamil, Finnish, Hungarian and many others. The total number of possible forms that a user might reasonably generate is far greater than the capacity of a computer to hold in its memory, search and retrieve unless the entire family of forms is compressed to a manageable size by virtue of the redundancies inherent in a computational morphology. It is typically the inflectional morphology which gives rise to the very large number of possible forms for nouns and verbs, and it is typically the inflectional morphology which can most usefully be stripped off when one wishes to build a NLP tool based not on actual words, but on the most useful part of the words. Syntactic parsing in most languages requires knowledge of the morphosyntactic features carried by each word, and that knowledge is generally understood as being wrapped up in the morphology (primarily the inflectional morphology) of the language. A number of researchers have explored the effect of statistical study of morphology for the NLP applications that are produced by incorporating knowledge of inflectional and derivational morphology (Harman (1991), Krovetz (2000), Hull (1996), Kraaij & Pohlmann (1996), Xu & Croft (1998), Goldsmith et al. (2001), Larkey (2002), and Savoy (2006)).

4. 2 APPLICATIONS

The results of the statistical study and their relevance in the selection and application in NLP are described in the following sections.

4. 2. 1 POS TAGGING

A word can be classified into one or more lexical or parts-of-speech categories such as nouns, verbs, adjectives, and adverbs, to name a few. Parts of speech (POS) tagging is the process of labeling annotation of syntactic categories for each word in a corpus. In other words, POS tagging is the process of labeling a part of speech or other lexical category to each and every word in a sentence. Tagging is also known as the primary phase in the assignment of structure to a text. For example, *avaṉ intap peṇṇai nēcikkiṟāṉ.*

avaṉ \PRN *inta*\DET *peṇṇai* \NC.acc. *nēci-kkiṟ-āṉ* \VM.prs.3s.mas .\PUN

Once the data is tagged either at a morphosyntactic or POS level then the State-of-the-art POS taggers can achieve a good accuracy using statistics to determine its function. Tagging text with parts-of-speech turns out to be extremely useful for linguistic research and more complicated NLP tasks such as parsing and machine translation are developed on this.

For some time, parts-of-speech tagging was considered as an inseparable part of natural language processing. Developing a correct parts-of-speech without understanding the semantics or even the pragmatics of the context could be extremely difficult. This is extremely expensive, especially because analyzing the higher levels is much harder when multiple parts-of-speech possibilities ought to be considered for each word.

In this context, it is impossible to think over research on parts-of-speech tagging without corpus. Corpus has been used for innumerable studies involving parts-of-speech, and also has inspired the development of similar "tagged" corpora in many other languages. However, now it has been superseded by involving larger corpora such as the 100 million words British National Corpus. For a corpus, there is a necessity for POS tagging so that the resources can be utilized in natural language parsing, machine translation, etc.

4. 2. 2 MORPHOLOGICAL ANALYZER

Morphological analysis is the process of segmenting words into morphemes or analyzing the process of word formation. It is a primary step for various types of text analysis of any language. Morphological analyzer takes a word as an input and produces the root, and its grammatical features as the output (Uma Maheshwar Rao, 2006). For example,

Input: oxen (English)

Output: {root = ox, category = n, number = plural}

It is used as one of the components in machine translation etc. Corpus is used in the development of morphological analyzer for enhancing its coverage. The partially developed tagged corpus can be used to improve morphological analyzer using bootstrapping methods.

Morphological analysis is a very significant step towards efficient NLP for highly inflectional languages like Tamil. Morphology is one of the complementary parts of the structural aspects of natural language expression. This study is particularly significant because, apart from acquisition of morphology we could focus on the natural language generation and also on the possible decompositions of the given word with probability of that occurrence. The Unsupervised Morphological analyzer can be improved by making it semi supervised. That is adding the learning algorithms which could learn the sandhi rules based on the output generated by the Rule based analyzer and applying these rules while decomposing. If such strategy is used then with small data we can generate large vocabulary and also improve the performance of a morphological analyzer.

4. 2. 3 MACHINE TRANSLATION

As we mentioned earlier that morphological study is an important task shared by many applications in the field of NLP. Closely connected to this

task, one of the main issues at hand when designing such applications is how to organize and store in the lexicon the morphological information needed to analyze and generate words. Machine Translation is typically one of the applications that need to handle analysis and generation processes at the same time. Linguistic databases for MT systems need to be designed so that the knowledge they store is as much process independent as possible. Thus designing declarative lexicon databases in MT applications is a must.

Machine Translation (MT) is a task with multiple components, each of which can be very challenging. MT makes it possible and easier to collect knowledge in other languages, as well as to distribute knowledge to other languages. Parallel corpus has been used as an aligned pair of any two languages in MT. The aligned data comes from a corpus. Parallel corpora involves two (or more) corpora in different languages, each containing text that have been translated from one language into to another (e.g. a novel in English that has been translated into Tamil, and one in Tamil that has been translated into English) or texts that have been produced simultaneously in two or more languages. They can be used by translators and by learners to find potentially equivalent expressions in each language and to investigate differences between languages. Some parallel corpora include European Union regulations, which are published in all the official languages of the European Union.

Using corpus approach to machine translation usually begins with a bilingual training corpus. This approach is to extract from the corpus for generalized statistical knowledge that can be applied to new, unseen test sentences. A different approach is to simply memorize the bilingual corpus. This is called translation memory, and it provides excellent translation quality in the case of a "hid" (i.e., a test sentence to be translated has actually been pre-observed in the memorized corpus).

MT systems may use a large monolingual corpus to improve the accuracy of translated words, phrases/sentences. The MT system may produce alternative translations and use the large monolingual corpus to (re)rank the alternative translations. The MT system may receive an input text segment in a source language, compare alternate translation for the said input text string in a target language and record a number of occurrences of the alternate translations in the large monolingual corpus. The MT system may then re-rank the alternate translations based, at least in part, on the number of occurrences of each translation in the corpus.

Statistical MT

What linguistic knowledge sources are needed to perform MT depends at least to a limited extent, on the method that is used. For example, some US projects (Brown et al., 1989) made use of very large scale statistical information from texts, while Japanese systems do not. Conversely, an experimental MT system at Kyoto University made use of large lists of sample sentences against which a sentence to be translated is matched (Nagao, 1990), whereas no US systems did this until the turn of the century (the CMU system). Most MT systems however, make use of at least some, or possibly all of the following kinds of lexical knowledge sources as distinct from corpora alone (as in Brown et al.). The morphological analysis has been shown to improve the results in automatic translation between languages with different morphological structures IN Indian Languages (Uma Maheshwar Rao and Amba K., 2008).

4. 2. 4 WORD SENSE DISAMBIGUATION

Word sense disambiguation is defined as the task of finding the correct sense of a word in a context. This is crucial for applications like Machine Translation and Information Extraction. Sense-tagged corpus is still not large enough to create the building of a wide coverage, high accuracy Word Sense

Disambiguation (WSD) program that can significantly outperform the most-frequent-sense classifier over all content words encountered in an arbitrarily chosen unrestricted text. The amount of human annotation effort needed can be considered as an upper bound on the manual effort needed to construct the necessary sense-tagged corpus to achieve wide coverage WSD using statistics. It may turn out that we can achieve our goal with much less annotation effort.

Large text corpora and the computational resources to handle them have recently become available to computational linguists. In order to apply to multi-million word corpora, natural language processing techniques must be efficient and domain-independent; for this reason, coarse or partial analyses are becoming more attractive. For example, coarse syntactic interpretation, such as partial parsing (de Marcken 1990) (McDonald 1990) and automatic collocation generation (Smadja & McKeown 1990) (Chouek 1988) are being explored.

Bootstrapping From Bilingual Corpora

The time required for hand-labeling the training sentences are prohibitive, but there is a way it might be automated. Recently several researchers (e.g. (Brown et al. 1991), (Dagan et al. 1991)) have suggested using bilingual aligned corpora in the lexical disambiguation task, (the term "aligned" indicates that within the bilingual database, sentences that are translations of one another are grouped together). Although most of the discussion is in terms of choosing words for translating one language to another, it is also suggested that, because the words that have more than one sense in language A have only one sense or a different set of senses in language B, by using a most frequently occurring bilingual dictionary, the correct sense of a word in language A can be determined by comparing it with its translation in B. This disambiguation method has limited applicability, of course, because it requires a bilingual corpus. However, a corpus of translated text could be used to bootstrap catchword, providing it

with initial training instances (sentences containing a target homograph tagged with its sense), thereby eliminating the hand-labeling step.

Corpus-based methods are called 'supervised' when they learn from previously sense-annotated data, and, therefore, they usually require a large amount of human intervention to annotate the training data Ng (1997). Although several attempts have been made for example, Leacock (1998), Mihalcea (1999), Cuadros (2004), the knowledge acquisition bottleneck (too many languages, too many words, too many senses, too many examples per sense) is still an open problem that poses serious challenges to the supervised learning approach for WSD among Dravidian Languages including Tamil.

4. 2. 5 FINITE STATE TRANSDUCERS

A large part of the work on computational morphology has involved the use of finite-state devices, including the development of computational tools and infrastructure. Finite state methods have been used to handle both the strictly morphological and morphotactic states. We encounter the way in which strictly morphological information can be implemented with a finite state automaton, as in Figure 1.

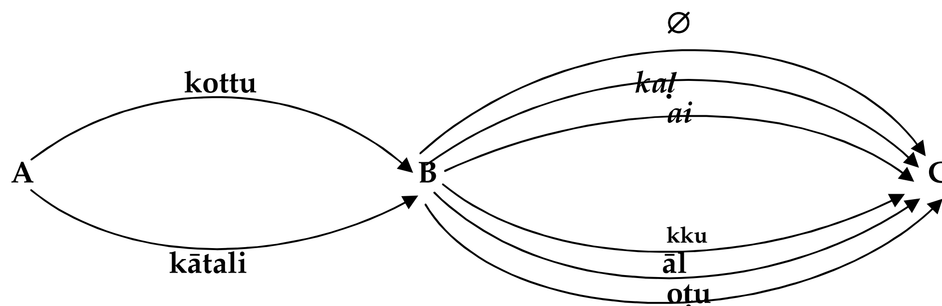

Figure-1

By extending the notion of finite state automaton to that of finite state transducer, we can use much the same notions in order to generate the correct

surface morphemes and also create a device that can map surface sequences of letters (or phones) to abstract morphosyntactic features such as number, case and tense, aspect, mood etc. Computational morphology has also applied the notion of finite state transducer to deal with the problem of accounting for regularities of various sorts concerning alternative ways of realizing morphemes. For example, in Tamil, both the nominal suffix marking plural, case marker, clitic and the verbal suffix tense marking 3rd person singular is normally realized as *-ai, -ukku, -āl* for nouns *-āṉ, -āḷ, -atu* in the verbal inflection. We refer to this aspect of the problem as morphotactics, respectively. It would take us too far a field to go through an example in detail, but one could well imagine that the formation of the plural form of *maram* could be broken up into successive stages: maram + kaḷ → maraṅ + kaḷ → maraṅkaḷ. Here, we see the suffixation of the plural '-kaḷ' happening first, followed by the change of *-am* to -ṅ. In contrast, finite-state automata offer a way of dealing with the central phenomena of morphology without recourse to such a step-by-step inflection and derivation: hence the term 'two-level morphology,' which employs only two levels: one in which morphosyntactic features and lexical roots are specified, and one which matches the spelled (or pronounced) form of the word.

4. 2. 6 SPELL CHECKER

The purpose of spell checking is the detection and correction of typographic and orthographic errors in the text at the level of *word occurrence* considered out of its context. Nobody can write without any errors. Even people well acquainted with the rules of language can, just by accident, press a wrong key on the keyboard (maybe adjacent to the correct one) or miss out a letter. Additionally, when typing, one sometimes does not synchronize properly the movements of the hands and fingers. All such errors are called *typos*, or *typographic errors*. On the other hand, some people do not know the correct spelling of some words, especially in a foreign language. Such errors are called *spelling errors*.

First, a spell checker merely detects the strings that are not correct words in a given natural language. It is supposed that most of the orthographic or typographic errors lead to strings that are *impossible* as separate words in this language. Detecting the errors that convert by accident one word into another existing word, such as English *then* → ?*than* or Tamil *paḷḷi* (பள்ளி) → ?*palli* (பல்லி), supposes a task which requires much more powerful tools.

After such impossible string has been detected and highlighted by the program, the user can correct this string in any preferable way - manually or with the help of the program. For example, if we try to insert into any English text the strings 3 **groop*, **greit*, or **misanderstand*, the spell checker will detect the error and stop at this string, highlighting it for the user. Similarly if one types wrong spelling in Tamil, it can highlighting for the user *kaṭṭūrai (கட்டுறை), **a̲nuppuṉar* (அனுப்புனர்) **pallam* (பல்லம்) can be highlighted it for the user.

The functions of a spell checker can be more flexible. The program can also propose a set of existing words, which are *similar* enough (in some sense) to the given corrupted word, and the user can then choose one of them as the correct version of the word, without re-typing it in the line. In the previous examples, Microsoft Word's spell checker gives, as possible candidates for replacement of the string *aṇṇaṉ*, the existing Tamil words shown in Figure-3.

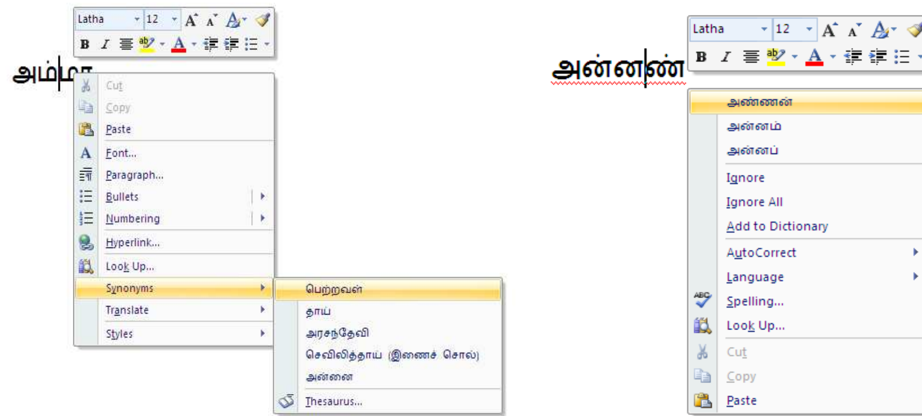

Figure-3

In most cases, especially for long strings, a spell checker offers only one or two candidates (or none). For example, for the string **a̲nuppu̲nar*, (அனுப்புனர்) it offers only the correct Tamil word *a̲nuppunar* அனுப்புநர்).

The programs that perform operations of both kinds are called orthographic correctors, while in English they are usually called spell checkers. In everyday practice, spell checkers are considered very helpful and are used by millions of users throughout the world. In the modern text editors, if we take into consider the statistical study of Tamil morphology would certainly enhance the output of spell checker.

4. 2. 7 USE OF N-GRAM IN NLP

An n-gram is a stretch of text *n* character and words long. Information in n-grams tells us something about language, but doesn't capture the structure. Finding and using every, e.g., two-word collocation in a text is quick and easy to do. An n-gram can help in a variety of NLP applications like character and word prediction and it can be used to aid in predicting the next character, word of an utterance, based on the previous n -1 words and also it is useful for context-sensitive spelling correction, approximation of language and so on. We make use of these corpora for n-gram with frequencies and their probability and percentage. Simple n-grams let us assume we want to predict the next word, based on the previous context of *I dreamed I saw the knights in.* What we want to find is the likelihood of w7 being the next word, given that we have seen w1, ...,w6, in other words, P(w1, ...,w7). In general, for w_n, we are looking for:

(1) $P(w1, ...,w_n) = P(w1)P(w2 | w1)...P(w_n | w1, ...,wn-1)$

But these probabilities are impractical to calculate: they hardly ever occur in a corpus, if at all and it would be a lot of data to store, if we could calculate them.

4. 3 APPLICATION TO SPEECH TECHNOLOGIES

Models of pronunciation variations are directly applicable to some branches of speech technologies, such as Text-to-Speech (TTS) systems and automatic speech recognition (ASR) systems. A TTS system, as the name suggest, convert written text to spoken speech. The system has many components, such as text analysis, duration prediction, and intonation prediction. Text analysis converts written text into phoneme string, duration prediction estimates how long each phoneme is, and intonation module predicts k=l contours. All relevant information are send to a speech synthesis component to produce speech output.

The text analysis component simulates the ability of an educated reader. Written text is analyzed and converted into a representation with morphological information, syllable structures, prosodic tags, phoneme strings and morpheme strings. Prediction of pronunciation variation is one area that presents interesting possibilities, but has hardly been explored in the TTS domain. This is primarily because the systems are still restricted to the reading mode.

Proper handling of pronunciation variations will be helpful in generating believable conversation speech, as well as simulating personal characteristics and regional accents. Speech recognition (ASR) is the reverse process of TTS. It takes speech as input and coverts it into text. TTS is an automatic reader, and ASR is an automatic transcriber. Pronunciation modeling is a crucial component of an ASR system. An ASR system evaluates acoustic signals against hypotheses of word pronunciation, based on transcriptions and pronunciation models. Multiple pronunciations of a word are annotated or generated so as to cover all the possible pronunciation variations. More complete annotation and good models of pronunciation variations can improve the performance of an ASR system. Pronunciation modeling of Tamil casual speech will be useful to integrate in ASR systems.

4. 4 LANGUAGE TEACHING AND LEARNING

In language teaching and learning morphology plays an important role. Annotation of corpora is needed in sentence level as well as in word level. In an agglutinative language like Tamil the words are highly inflected with morphemes. For the word analysis we need to segment the morphemes for further study and tagged its morphological categories. These grammatically annotated corpora are used for language teaching and learning. Tamil being a Dravidian language has a very rich morphological structure which is agglutinative, Tamil words are made up of lexical roots followed by one or more affixes. Lot of prior research has demonstrated that school and college level content words tend to be morphologically complex. Reading is the salient skill utilized across the curriculum and often the primary means of content dissemination. Reading, in turn, is principally linked to the extent of one's vocabulary. Consequently, teaching morphologically complex vocabulary at the school and college preparatory level along with providing a working knowledge of morphemes can assist students toward school college readiness.

Corpora and the teaching syllabus

Large general corpora have proven to be an invaluable resource in the design of language teaching syllabi which emphasize communicative competence (cf. Hymes 1972, 1992) and which give prominence to those items that learners are most likely to encounter in real life communicative situations. In the context of computer corpus informed English language teaching syllabi, the first and probably most groundbreaking development was the design of the Collins COBUILD English Course (CCEC; Willis/Willis 1989), an offshoot of the pioneering COBUILD project in pedagogically oriented lexicography (cf. Sinclair 1987). The contents of this new, corpus-driven "lexical syllabus" are "the commonest words and phrases in English and their meanings" (Willis 1990). With its focus on lexis and lexical patterns, the CCEC responds to some

of the most central findings of corpus research, namely that language is highly patterned in that it consists to an immense degree of repeated word-combinations, and that lexis and grammar are inseparably linked (cf. Hoey 2000; Hunston 2002; Hunston and Francis 2000; Partington 1998; Römer 2005a, 2005b; Sinclair 1991; Stubbs 1996; Tognini Bonelli 2001). Also worth mentioning is a much earlier attempt to improve further the teaching of English vocabulary that was made long before the advent of computers and electronic corpora. In 1934, Michael West organized a conference "to discuss the part played by corpus-based word lists in the teaching of English as a foreign language" (Kennedy 1992, 327). About 20 years later, West's (1953) General Service List of English Words (GSL) was published and has since then exerted great influence on curriculum design (cf. Kennedy 1992, 328; Willis 1990, 47). As the title indicates, West's GSL suggests a syllabus that is based on words rather than on grammatical structures. It is also based on frequently occurring rather than on rare words. Of course, frequency of occurrence is not the only criterion that should influence decisions about the inclusion of items in the teaching syllabus (there are other relevant criteria, such as "range, availability, coverage and learnability (Mackey 1965, 188)" (Kennedy 1992, 340); cf. also Nation 1990, 21), but it is certainly an immensely important one (see also Aston 2000, 8; Leech 1997, 16). It can be safely assumed that learners will find it easier to develop both their receptive and productive skills when they are confronted with the most common lexical items of a language and the patterns and meanings with which they typically occur than when the language teaching input they get gives high priority to infrequent words and structures which the learners will only rarely encounter in real-life situations.

Another thread in applied corpus research that aims to inform the teaching syllabus and also stresses the importance of frequency of occurrence, examines language items in actual language use and compares the distributions and patterns found in general reference corpora (of speech and

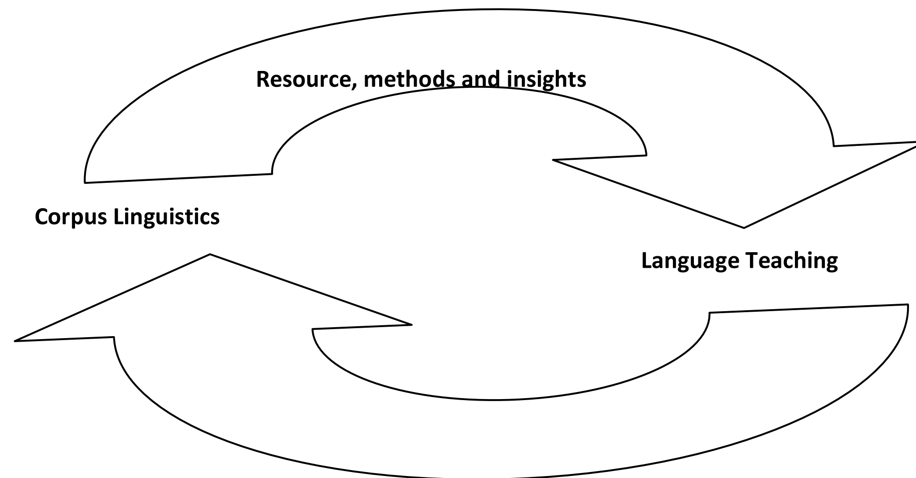

writing) with the presentations of the same items in teaching materials (course books, grammars, usage handbooks). The starting point for these kinds of studies is usually language features that are known to cause perpetual problems to learners, for example, for German, discourse particles (Jones 1997), modal verbs (Jones 2000), the passive voice (Jones 2000) prepositions (Jones 1997), or, for English, future time expressions (Mindt 1987, 1997), if-clauses (Römer 2004b), irregular verbs (Grabowski/Mindt 1995), linking adverbials (Conrad 2004), modal verbs (Mindt 1995; Römer 2004a), the present perfect (Lorenz 2002; Schlüter 2002), progressive verb forms (Römer 2005a, 2006) and reflexives (Barlow 1996). For all these phenomena, researchers have found considerable mismatches between naturally-occurring German or English and the type of German or English that is put forward as a model in the examined teaching materials. They have, as a consequence, called for corpus-inspired adjustments in the language teaching syllabus (particularly as far as selection and progression are concerned) and for revised pedagogical descriptions which present a more adequate picture of the language as it is actually used. A case in point here is the misrepresentation of the functions and contextual patterns of English progressive forms in EFL teaching materials used in German schools. Progressives that refer to repeated actions or events, for example, are considerably more frequent in 'real' English than in textbook English where the common function "repeatedness" is rather neglected and the focus is on single continuous events (cf. Römer 2005a, 261-263).

As Ellis point out us that language learners naturally rely on frequency for many different language tasks, ranging from irregular verb patterns to collocation patterns. Given its importance in acquisition, we would argue that frequency should also play a key role in the development of materials and in the choices that teachers make in language classrooms. With the recent availability of comprehensive frequency-based grammatical descriptions, such integration of pedagogy and research has become feasible. Actually,

textbook authors and students have been interested in frequency information all along. For example, many books include lists of common phrasal verbs or provide other information about patterns that are common or typical. However, more often than not, this information is based on the author's intuitions rather than empirical research. As a result, these lists often include forms that are not in fact common, while overlooking other forms that do occur frequently. (Surprisingly, extremely frequent forms are also the ones that we are most likely to overlook.) By using information based on actual frequency and context of use (e.g., register differences), materials developers and teachers should be able to increase the meaningful input that is provided to learners. Obviously, other factors are equally important - for example, some grammatical topics are required as building blocks for later topics; some grammatical topics are more difficult and therefore require more practice than others. In many cases, though, language use has been a primary guiding principle: Authors have attempted to present the typical and most important patterns first, moving on to more specialized topics in later chapters and more advanced books. Lacking empirical studies, authors have been forced to rely on their intuitions for these judgments about language use, and widely accepted norms have arisen to support those intuitions. With the rise of corpus-based analysis, we are beginning to see empirical descriptions of language use, identifying the patterns that are actually frequent (or not) and documenting the differential reliance on specific forms and words in different registers. In some cases, our intuitions as authors have turned out to be correct; in many other cases, we have been wrong. For those latter cases, revising pedagogy to reflect actual use, as shown by frequency studies, can result in radical changes that facilitate the learning process for students.

In this study, I wish to examine the relationship between corpus linguistics (CL) and language teaching (LT) and provide an overview of the most important pedagogical applications of corpora. As the below figure aims to illustrate, this relationship is a dynamic one in which the two fields greatly

influence each other. While LT profits from the resources, methods, and insights provided by CL, it also provides important impulses that are taken up in corpus linguistic research. The requirements of LT hence have a pact on research in CL and on the development of suitable resources and tools. This kind of study would investigate what influence CL has had on LT so far, and in what ways corpora have been used to improve pedagogical practice. It will also discuss further possible effects of CL on LT and of LT on CL, and highlight some future tasks for researchers and practitioners in the field.

4. 5 SPEECH RECOGNITION AND SYNTHESIS

Both applications can benefit from morphological information. As Demberg et al. (2007) showed that morphological segmentations provided by rule-based systems improve the grapheme to phoneme conversion process. For speech recognition in morphologically complex languages such as Finnish and Tamil and other Dravidian Languages, language models based on morphs instead of words are more robust with respect to the well-known problem of out of vocabulary words (Creutz et al., 2007).

4. 6 TERMINOLOGY

Most of the work in terminological data processing focuses on the detection of lexical variants in complex terms, in order to fine-tune controlled term indexing and term extraction. Amongst the lexical phenomena that make a

term vary in context, morphology (both inflectional and constructional) plays an important role (Jacquemin et al., 1997).

4. 7 TEXT CLASSIFICATION

Linguistic units which are morphologically motivated can be used as features for text categorization, leading to a reduction of the dimension of the feature vectors and improved performance for a language with many compounds such as German (Witschel and Biemann, 2006). Thus, statistical study of morphology is useful for a large variety of NLP applications.

4. 8 CONCLUSION

The statistical study of morphology on corpus of Tamil language has been used to improve dramatically in the last decades. These improvements had a positive effect on the computational linguistics areas. We have seen that how these NLP applications such as morphological analyzer, morphological generator, machine translation, parts-of-speech, word sense disambiguation and spell checker etc, are made use of statistical study of Tamil morphology which is very importance to enhance these systems.

CHAPTER-5

5. 0 CONCLUSION

The research reported here demonstrates that it is possible to obtain extremely important information from the analysis of corpora using computer. In fact it is necessary to have such an exercise for analyzing a language. We have extracted comprehensive information with regard to various linguistic elements from the corpora of Tamil. The task involves the extraction of corpora-based quantitative information with regard to the distribution in numbers and their percentage of such units viz., sequence of two, three, four characters, sequence of two, three, four morphemes, sequence of two, three, four words and their percentage coverages in the corpus. The quantitative morphemic information obtained for the Tamil prefixes, roots, suffixes, and characters in the corpora (chapter 3) indicate that this statistical analysis would be useful in enhancing the NLP applications, viz. morphological analyzer, POS tagger, word sense disambiguation, machine translation, computational lexicography, morphological generator, dictionary tools, lemmatization, speech applications, grammar checking, and spell checking etc.

For a meaningful modeling of the morphology of a language, particularly, Tamil, it is essential to study the corpus to get an overview of the word and their distribution where the entire forms are highly agglutinative. There are various advantages of studying corpus particularly by those who work in the area of NLP (Natural Language Processing). It is, by far, useful not only in building and formulating rules but also in testing them. Studies on corpus with a focus on a particular linguistic structure can lead to a better understanding of the problems such as usage, styles and their cognitive related perspectives involved. Corpus can be used as an immediate source to

extract and retrieve useful information in building natural language applications.

In the first chapter we have discussed the importance of statistical study of the morphology of Tamil which is considerably rich and complex. For the purpose of understanding the complexity of Tamil Morphology and to find out the specific patterns of the same, the researcher needs an extensive study on the productivity of morphological paradigms.

In the second chapter we have discussed the techniques and tools that were used and the methodology that is being adopted for the statistical analysis of Tamil morphology based on the corpora.

In the third chapter we have examined the productivity of morphological formatives. Consequently, it is known that Tamil has more plentiful productive suffixes. We showed that the intuitions about productivity often have a statistical interpretation that can be derived from the distribution of words of a particular morphological class in the corpora. Finally, corpus-based statistical approaches have a practical application to various natural language processing tasks. In the case of Tamil, one important such application is about word segmentation.

In the fourth chapter, we described an importance of the statistical study of morphology and how it can be used to exploit in various Natural Language Processing applications for Tamil. The morphological strength of languages demands the use of thorough morphological analysis. Morphological analysis should be the first step towards any language processing task. We discussed here how this morphological analysis of the language assists in building and testing of NLP applications and enhancing their coverages too.

In the conclusion we would like to emphasize that Corpus is "a collection of naturally occurring examples of language, consisting of anything

from a few sentences to a set of written texts or tape recording, which have been collected for linguistic study" (Hunston, 2002, p. 2). The most obvious thing to count in a corpus is the number of tokens for each word. Even this simple task poses some challenges for the linguistically minded researcher, because the computationally natural definition of words as maximal non-space strings delimited by whitespaces will not, as a rule, yield a reasonable classification of types although there are some facts to support the already existing phenomena.

We have demonstrated the applicability of learning of morphological analysis, by reformulating the problem as a classification task in which, letter, morpheme and word sequences are classified as marking different types of boundaries. A comprehensive morphological analysis is necessary for agglutinative language like Tamil where if one requires the information related with word structures. In Tamil, beginning with a word root, both inflectional and derivational suffixes are stacked together into one string, the translation of which into a non-agglutinative language requires a multitude of words. The stacking process sometimes exhibits recursive structure as in the case of syntactic processes like relativization, which is found naturally more feasible in the huge lexicon. It is obviously efficient to put all the word forms to be generated from the word root in the corpora.

Corpus provides resources for the study the morphological structure of words. In morphology it is useful to discover the frequency of variants and the productivity of affixes that go with roots. It has been observed that there are many corpus linguists who are more interested in Computational aspects than pure linguistics. They have used corpora for research in the area of Computational Linguistics or Natural Language Processing (NLP) (cf. Meyer, 2002). A statistical analysis of Tamil Morphology following various computational techniques better serve a number of purposes in enhancing and building NLP applications as discussed earlier. A statistical study of any

morphology may discern our knowledge especially in the area of standardization of that language used in the written domain.

The quality and the development of many NLP applications rely on the availability of large amount of textual data today. Many applications use statistical methods that are trained on an electronic corpus. Machine Translation is a case in point. With the arrival of fast computers and large amounts of machine-readable texts in the 1970s, it has become possible to start using corpus-based computational techniques for translation purposes. Today, parallel corpora and various alignment techniques in Machine Translation and Machine aided Translation are increasingly used.

Corpus is a basic resource for empirical linguistic research. Corpora are readily available objective materials for analysis, since the samples are representative of language in use, easily accessible, natural and rich resources. It is easy to employ these resources for analysis since it is often enriched in terms of annotation useful for NLP applications.

Only most frequently occurring words, morphemes, characters and their collocations have been investigated. Less frequently occurring words are not excluded but not shown for want of space. Therefore, statistical results and interpretations of low frequency words were not taken into discussion. Collocations of characters and words have been studied. To instantiate the literature, the word '*kātali*' occurs or collocates with '*ta<u>n</u>atu kātali*', '*kātalittu tirumaṇam*', '*kātalittu vanta<u>n</u>ar*', '*tīviramāka kātalittu*', '*kātalittu vantār*', '*peṇṇai kātalittu*' from the corpora.

The relevant insight is provided by the current research on the nature of roles of characters, strings, and various word types clearly explores that words are not merely the minimum units or unique forms, but they can be further divisible into elements (i.e., morphemes) with the implied distributional patterns directly relevant to their function meaning. To be

precise, it is felt that this thesis provides a firm landing site of further NLP research. The research reported from the analysis of the collected Tamil corpora of texts of different domains into numerical sequences of morphemes (prefixes, roots and suffixes) or characters and words in bigrams, trigrams show their statistical coverage. Hence, this computationally highly useful and relevant frequency data can be utilized for relevant NLP applications to improve the coverage.

Annotated training datasets are not readily available for many Indian languages. Moreover, they have to be constituted manually by an expert, which costs both money and time. As a consequence, lots of research has been devoted during the last ten years to the development of methods for the unsupervised acquisition of morphological knowledge. These methods do not rely on language-specific resources and proceed from simple word, syllable, character lists or textual corpora. They usually aim at splitting words into morphemic segments or discover families of morphologically related words.

We have presented here a few simple quantitative results i.e. frequency counts and their percentage, which executed at word, morpheme and character level in Tamil text corpus along with some discussions on the findings. Despite certain limitations, statistical results obtained from the corpus and their corroborative analyses have multiple applications both in language technology and general linguistics. Within the area of language technology, these findings are considered useful for designing systems for cryptography, type writing, computer keyboard, telegraphic encoding, spell checking, machine translation, information retrieval, etc. On the other hand, within mainstream linguistics, these results are valuable inputs for information-theoretic analysis of language, descriptive analysis of language, dictionary compilation, language teaching, and other activities.

Morphology is a key component for many Language Technology applications. However, morphological suffixes, including derivation and compounding are often addressed in a superficial manner so one has to give importance to frequently occurring each morphemes and sequence of morphemes in

morphology. Natural Language Processing (NLP) systems rely, in various extents, on language resources corresponding to the various levels of linguistic description, i.e. morphology, syntax or semantics. Among them, morphological knowledge is considered as a key resource for improving NLP applications. Inflectional morphology is broadly used, especially in POS-tagging tasks and for the rationalization of lexicon organization. However, when looking at the way derivational and compositional morphology is tackled in many NLP projects, it is striking to see how superficially morphological relations are sometimes addressed and how little attempt is made at using deep and motivated morphological knowledge. On the other hand, many research efforts and interesting findings have been made in the past decades in the understanding and automatic processing of word-formation processes, either in rule-based systems such as DériF (Namer, 2009) or empirical approaches like Linguistica (Goldsmith, 2001) or Morfessor (Creutz and Lagus, 2007). This lead to the development of tools of great coverage and complexity for the processing of morphology in various languages, and to the building of extended lexical resources for specific phenomena.

Based on 3 million words corpus, we highlight the kind of linguistic knowledge that is necessary for this particular task and this study conducts a qualitative analysis of morphological phenomena to identify the morphological processes that are most relevant. Moreover, the study also took the task of evaluation of existing tools and resources for Tamil morphology, in order to quantify their coverage. Finally, we argue that these kinds of studies are a prerequisite before building appropriate lexical resources that would have a significant impact on the application performance.
